# Federated States of Micronesia (Chuuk) <br> NCD Risk Factors STEPS REPORT 

Printed in Suva, Fiji
May, 2012

## Acknowledgements

The Federated States of Micronesia (Chuuk) NCD Risk Factors STEPS Report (referred as "the Report") is a record of a combined effort of several organizations and individuals. We would like to acknowledge each organization and everyone's contributions, dedication and determination in completing the survey and finalizing the Report.

The Report is a collaborative effort between the Federated States of Micronesia (referred as "FSM") Department of Health and Social Affairs, Department of Health Services of the State of Chuuk, FSM, and World Health Organization (referred as "WHO").

The Report compiled by: Mr Marcus Samo (FSM), Dr Graham Roberts (UNSW), Dr Li Dan (WHO, Suva), Mr Julio Marar (Chuuk, FSM), Ms Leanne Riley (WHO, Geneva), Ms Moria Shomour (Chuuk, FSM), Mr Shalvindra Raj (WHO, Suva), Mr Kipier Lippwe (FSM), Dr Dorina Fred (Chuuk, FSM), Mr Amato Elymore, Mr Carter Apaisam (FSM), Mr Abrahm Rold and Mr Sanphy William (Chuuk, FSM).

Great appreciation is to the Department of Health and Social Affairs, FSM, thanks to the Secretary for Health and Social Affairs, Dr Vita A. Skilling and the Director of Health Services, Chuuk, FSM, Mr Julio Marar for their support. Thanks to Dr Jan Pryor and Ms Shakila Naidu, former staff of Fiji School of Medicine, for conducting the training. A special thank to the staff for the field survey.

Grateful acknowledgement is made to Dr Dongil Ahn (Director, Pacific Technical Support and Representative, South Pacific, WHO Office in Suva) and Dr Han Tieru (Director, Division of Building Healthy Communities and Populations, WHO Office in Manila) for their great support. We acknowledge the statistical support and result generation provided by Ms Leanne Riley, Ms Melanie Cowan, Ms Regina Guthold (WHO Office in Geneva), Mr Shalvindra Raj who made substantial contribution to the completion of data analyses. The FSM (Chuuk) STEPS survey and the Report were funded by the Australian Agency for International Development (AusAID), New Zealand Agency for International Development (NZAID), and WHO. Chuuk Department of Health Services and FSM Department of Health and Social Affairs provided funding-in-kind.

Dr Graham Roberts (University of New South Wales) drafted the first version of the Report, working closely with WHO Office in Suva. Dr Li Dan, Ms Leanne Riley, Dr Philayrath Phongsavan (University of Sydney), Dr Andrew Colin Bell (WHO Office in Suva), Dr Hai-Rim Shin, Dr Cherian Varghese (WHO Office in Manila), Mr Shalvindra Raj, Ms Regina Guthold and Ms Melanie Cowan have conducted technical reviews for the Report.

The country consultations held in Chuuk and Pohnpei, FSM were attended by Mr Marcus Samo, Mr Resty Shotaro (Chuuk, FSM), Mr Kipier Lippwe, Ms Moria Shomour, Dr Kino S. Ruben, Ms Maurita H. Bualuay (Chuuk, FSM) and Dr Li Dan. During the country consultation, the "Love Stick" and "Devil Mask", as the symbols of Chuuk, FSM, were selected to be put at the bottom of the cover of the Report. Traditionally, "Love Stick" was a carved wooden stick with a unique pattern which was used as a social product of expression, identification and feedback between young lovers during dating; "Devil Mask" was a carved wooden mask to scare the ghost away from stealing food.

Dr Li Dan, Dr Philayrath Phongsavan and Dr Graham Roberts are the final technical and editorial reviewers of the Report.

WHO Suva Office arranged the printing, on behalf of FSM Department of Health and Social Affairs.

## FOREWORD

In the world today, a dramatic increase in chronic noncommunicable diseases (NCDs) that leads to death has been experienced in almost every country. In order to address this growing problem effectively and efficiently, we must have accurate information regarding the risk factors that contribute to the development of NCDs. We also must have scientific NCD data to identify the intervention on NCDs and their risk factors. A "Risk factor" of NCDs refers to any characteristic or exposure that increases a person's likelihood of developing a NCD. These risk factors include tobacco use, harmful alcohol use, physical inactivity, obesity, high blood pressure, a raised level of cholesterol, a raised level of blood glucose, and an unbalanced diet. Each country needs to establish its capacity in order to conduct population risk surveillance over time for the planning of program activities and services.

We are pleased that the World Health Organization (WHO) has been working with us to strengthen our national and state capacity in population risk factors survey and analysis. The Federated States of Micronesia (Chuuk) NCD STEPS survey was specifically designed to assess the prevalence of the common NCDs and their risk factors in our population. The information from this survey provides an important platform for the development and implementation of strategic plans and programs to address the growing epidemic of NCDs in Chuuk, FSM.

This report showed a high prevalence of NCDs and their risk factors among our population and suggests actions to: control and prevent NCDs; provide a supportive physical environment and infrastructure, and improved health service delivery.

This is the first state-wide population-based survey on the prevalence of NODs and their risk factors in the history of the State of Chunk, FSM. It is a milestone to address the increasing NCD epidemic affecting our people and marks an increased commitment by the FSM Department of Health and Social Affairs and the Chuuk Department of Health Services to tackle the NCD challenge.

The survey results and recommendations will enable us to develop more effective health policies and programs in primary and secondary NCD prevention and in monitoring and evaluating our ongoing efforts in NCD prevention and control, so as to deal with the emergency declared on NCD in Chuuk.

We would like to thank all the staff of the Ministry of Health, partners for completing the first ever NCD population survey in Chuuk, FSM, thank WHO for its strong and excellent technical support, and thank AusAID and NZAID for the financial support. This report is dedicated to the hard work and commitment evidenced from the inception to the completion of the NCD Risk Factors STEPS survey in Chuuk.

We hope that the findings and recommendations in this report will guide our actions for preventing and controlling NCDs and improving health for all in Chuuk, FSM.

Dr Vita A. Skilling
Secretary
Department of Health and Social Affairs
Federated States of Micronesia

The WHO STEPwise Approach to Surveillance of Risk Factors for NCDs (STEPS) is the WHO recommended surveillance tool for chronic disease risk factors and chronic disease-specific morbidity and mortality at national level. To date, more than 147 countries and areas throughout the world utilize WHO STEPS to conduct national surveys on risk factors of chronic disease and morbidity of NCDs. The publication of the "Federated States of Micronesia (Chuuk) NCD Risk Factors STEPS REPORT" marks a milestone as it provides the scientific, updated and comparable data that will assist the government in addressing the escalating issue of NCDs.

The 10 published NCD STEPS reports across the Pacific have identified the extremely high prevalence of NCDs over the past decade occurred in the Pacific island countries and areas (PICs), causing up to $75 \%$ of all deaths and a similar percentage of long term illness and disability. Declared at the 9th Health Ministers' Meeting held in June, 2011 that the Pacific island countries and areas is in a NCD crisis requiring urgent attention and action.

The Federated States of Micronesia (Chuuk) STEPS Survey was conducted in 2006. Some of the key results of the survey and the report, for the age group of 25-64 years old, include the following:

- $28.7 \%$ of the population smoked tobacco daily.
- $12.8 \%$ of population chewed betel nuts daily, among them men (17.7\%) were significantly higher than women (8.1\%).
- $49.6 \%$ of men drank an average of 5 or more standard drinks of alcohol, 43.5\% of women drank an average of 4 or more standard drinks of alcohol per day in the past week.
- $90.4 \%$ of the population consumed less than five combined servings of fruit and vegetables per day.
- $63.1 \%$ of the population was with low level of physical activity.
- The prevalence of overweight in the population was $76.5 \%$, the prevalence of obesity was $47.3 \%$.
- The prevalence of diabetes in the population was $35.4 \%$.
- The prevalence of hypertension was $15.2 \%$.

These results clearly document that NCDs are a major problem in Federated States of Micronesia (Chuuk). The STEPS results can be used for formulating or updating the national and state-level NCD strategy, evaluating the impact of integrated NCD intervention activities, monitoring trends and comparing the NCD data with Pohnpei, FSM, other PICs and many countries in the world.

Future priorities need to be given to both primary and secondary prevention activities to prevent and control key NCDs, including diabetes, cardiovascular diseases, cancer, and their risk factors including smoking use, unhealthy diet, physical inactivity and harmful use of alcohol.

WHO is honoured to be a critical part of the collaborative efforts between the Federated States of Micronesia Department of Health and Social Affairs, Chuuk State Department of Health Services, Australian Agency for International Development and New Zealand Agency for International Development to complete the Federated States of Micronesia (Chuuk) STEPS survey and the report.

WHO is proud to collaborate with the Federated States of Micronesia in publishing this first Federated States of Micronesia (Chuuk) NCD Risk Factors STEPS Report, and will continue to work with health authorities, health workers and the public to address the issues raised in this report.

Dr Dongil Ahn
Director, Pacific Technical Support
Representative, South Pacific
World Health Organization

## EXECUTIVE SUMMARY

The Federated States of Micronesia (Chuuk) NCD STEPS survey provides the baseline assessment of the risk factors of noncommunicable diseases (NCDs) and their associated risk factors among Chuuk Islanders.

The key objectives of the NCD STEPS survey were:

- To document the prevalence and magnitude of key NCDs among adults
- To document the prevalence and magnitude of major modifiable risk factors for NCDs including tobacco use, betel nut use, harmful use of alcohol, poor eating patterns, physical inactivity, obesity, high blood pressure, raised blood glucose and cholesterol levels
- To compare NCDs and their risk factors across different age groups and between men and women.

A total of 2,831 individuals aged $15-64$ participated in the survey. The sample was equally distributed across age groups. Educational levels were consistent across sex and age groups, apart from females aged 55-64, who had received marginally less years of education. This report's main tables present data and commentary on the sample aged 25-64 years ( $n=2,034$ ), following the standard age group reporting for WHO STEPS surveys. Additional results for 797 respondents aged 15-24 years are also provided at the end of each section of Step 1.

## Step 1. Behavioural risk factors

Overall, the prevalence of current smokers among those aged 25-64 years was 32.4\%. More than half of men (51\%) were current smokers compared to only $14 \%$ of women. Among the total population, $28.7 \%$ smoked daily, with a gender difference of $47 \%$ of men and $10.6 \%$ of women. The mean age of smoking uptake was 18 years, although people in the 15-24 years age group reported starting at 15.5 years, suggestive of a recent reduction in the age of smoking uptake. The mean duration of smoking in both sexes combined was 22.9 years, and $84 \%$ of current smokers smoked manufactured cigarettes.

Betel nuts were chewed by $31.8 \%$ of men and $13.3 \%$ of women, mostly in the age group 25-34 after which chewing betel use declined. Of males and females combined $22.5 \%$ chewed betel in the last 12 months and $12.8 \%$ on a daily basis. Importantly, the proportion chewing betel nut (54.8\%) among those aged 15-24 was more than double the older groups.

A significant gender difference was found in alcohol consumption between males and females, with $34.3 \%$ of males and only $1.3 \%$ of females consuming alcohol in the past 12 months. Combined, $17.7 \%$ of the population had consumed alcohol in the past 12 months while $11 \%$ of the population ( $n=222$ ) was classified as current drinkers (drank in the last 12 months) of whom $73 \%$ were males and $27 \%$ females. Drinking was highest in the age group of $25-34$ (23.7\%) mostly due to men (43.3\%). Half (49.6\%) of male current drinkers reported drinking more than 5 standard drinks on a drinking day and $16.7 \%$ reported drinking $20+$ drinks in the past 7 days. The highest proportion of binge drinking among men was in the oldest age group 55-64 although drinking levels were not
statistically different among men of all age groups. Of those aged 15-24 alcohol consumption status did not differ significantly from older age groups.

Just over ninety percent (90.4\%) of Chuuk Islanders consumed fruit and vegetables at a rate below the recommended levels of 5 combined servings of fruit and vegetables per day. The mean number of days per week fruit and vegetables were consumed was 2.6 and 3.1 days, respectively. When fruit and vegetables were both consumed on those days, the self-reported mean number of combined fruit and vegetables servings was 2 serves per average day with no difference between sexes.

The survey found that $63 \%$ of the population reported a low level of total physical activity, that is, less than 600 METminutes per week. 600 METminutes per week are equivalent to 30 minutes of moderate-intensity physical activity for 5 days per week, or 20 minutes of vigorous activity for 3 days per week. A greater proportion of women (68\%) undertook low level of physical activity than men (59\%). Conversely, a higher proportion of men reported a high level of total physical activity than women (31\% and $20 \%$ respectively) largely due to work-related activities. The greatest part of physical activity in Chuuk was undertaken as part of work, followed by transport and then recreation-related activities. Young people aged 15-24 partook in less work related physical activity than older cohorts, while young males did significantly more recreation related physical activity than young females.

## Step 2: Physical risk factors

Males were significantly taller ( 169.2 cm ) than females ( 158.9 cm ). Mean weights for females were higher than for males in age groups 25-34 and 35-44 and lower in the older age groups but the overall difference was not statistically significant.

More than three quarters of the population was classified as overweight. The overall prevalence of overweight ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) was $76.5 \%$ ( $65 \%$ of males and $88 \%$ of females). Those considered obese ( $\mathrm{BMI} \geq 30 \mathrm{~kg} / \mathrm{m}^{2}$ ) was $47 \%$ overall ( $31 \%$ of males and $63 \%$ of females). Less than a quarter (23\%) of the population ( $34.4 \%$ of males and $11.8 \%$ of females) had a normal body mass index ( $18.5 \leq \mathrm{BMI}<25 \mathrm{~kg} / \mathrm{m}^{2}$ ).

Mean waist circumference was statistically different between the sexes overall ( 94.3 cm in males and 101.4 cm in females) due to large differences in age groups 25-34 and 4554 but were not significantly different in older groups. Women in all age groups had mean waist circumference values exceeding 88 cm , a cut-off value for women considered to increase cardiovascular disease risk. Mean waist circumference for males in all age groups remained below 102 cm where the risk of cardiovascular disease increases.

The results showed that $15.2 \%$ of the population was hypertensive (defined as having SBP $\geq 140 \mathrm{mmHg}$ and/or DBP $\geq 90 \mathrm{mmHg}$ or on medication for raised blood pressure). Hypertension increased with age in both genders, increased significantly in the 45-54 years age group and was highest (43\%) in men in the 55-64 years age group.

## Step 3. Biochemical risk factors

Based on measures of fasting capillary whole blood, the overall prevalence of diabetes (fasting glucose level $\geq 6.1 \mathrm{mmol} / \mathrm{L}$ or on medication for raised blood glucose) in the population aged $25-64$ years was $35.4 \%$ with no statistical differences between sexes but with statistically significant increases from age 35-44 to $45-54$ in both sexes. The highest rate is among both men and women aged 55-64 (69.4\% and 63\% respectively).

Overall, $19.2 \%$ of the sample was found to have raised total blood cholesterol levels exceeding $5.0 \mathrm{mmol} / \mathrm{L}(\geq 190 \mathrm{mg} / \mathrm{dl})$ increasing by age in both sexes. The increase in women in age group 55-64, where almost half (47.1\%) of the population had raised cholesterol, is statistically significantly different from the rate in males of the same age and from the preceding female age group.

## Combined risk factors

As the number of NCD risk factors for an individual increases, so does the risk of developing a NCD. STEPS reports classify the surveyed population into three NCD risk categories: High Risk (with 3-5 risk factors), Moderate Risk (with 1-2 risk factors) or Low Risk (with no risk factor). The combined NCD risk factors included in the computation of NCD risk categories were current daily smokers, overweight ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ), raised blood pressure (SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication), consuming less than five combined servings of fruit and vegetables per day, and a low level of physical activity (<600 METminutes per week).

This survey found that overall $62.4 \%$ of the population was at High Risk of NCDs, shared equally among males and females, but significantly increased in the age group 45-64.

## Conclusion

The survey has provided strong evidence that NCDs and related modifiable risk factors are prevalent in Chuuk to the degree where overall $62 \%$ of the sample population was classed as being at High Risk of NCDs. The Chuuk STEPS survey represents a significant step forward in gathering information for the national and state strategy for the prevention, control and management of NCDs.

While rates of overweight for males is a concern and prevalence of diabetes are similar, differences between the sexes indicate that males are more likely to smoke, drink alcohol to excess, chew betel nut while young and, among older men, eat less fruit and vegetables than others. Females are more at risk from lower levels of physical activity, being overweight or obese and having a high waist circumference, and, particularly, higher levels of blood cholesterol at older age.

These factors identify potential to target health promotion and disease prevention programs to alter behavioural and lifestyle factors that contribute to NCD risks.

Accordingly, the following recommendations are outlined as priority actions for the State of Chuuk:

## Addressing Information needs

That the Department of Health:

- Use the opportunity of the publication of this Chuuk NCD Risk Factors STEPS Report to initiate a new NCD risk factor awareness and reduction campaign in the State of Chuuk
- Establish strong leadership and secure political and financial commitment to maintain a systematic and rigorous approach to STEPS data collection supported by a workforce trained in implementing the survey, in order to create an ongoing and robust STEPS surveillance system in Chuuk.
- Repeat the NCD STEPwise surveys periodically to determine the effectiveness, or otherwise, of NCD prevention and control measures implemented in Chuuk.
- Participate in the comparison of NCD STEPS data across other Pacific Island countries and areas that have completed the NCD STEPS surveys, in order to identify the risk factors that are particular to and most amenable to modification, as well as to identify the evidence-based prioritized intervention in Chuuk, FSM.

## Addressing policy, organizational and environmental factors

That government of FSM:

- Earmark funds for ongoing NCD strategy implementation and monitoring
- Implement the WHO Framework Convention on Tobacco Control
- Consider the potential for manufacturers and importers of cigarettes and alcohol to be taxed to the degree that they subsidize health promotion initiatives.
- Generate resources for ongoing national health education programs aimed at national and personal productivity
- Develop policies supporting the growth and importation of healthy foods
- Improve the availability of fruit and vegetables
- Increase tax on certain imported unhealthy food items, like turkey tails, corned beef and spam
- Develop policies to establish physical activity-friendly environments, such as walking tracks, sports facilities and workplace fitness programs

## Addressing NCD behavioural risk factors

That government, Department of Health and NGOs create and provide:

- Comprehensive no-smoking and no-betel nut use campaigns to reduce tobacco use rates, particularly targeting teenagers and the younger adult age groups to prevent smoking uptake, and smoking cessation programs to reduce smoking rates across all age groups
- Comprehensive health promotion campaigns to reduce alcohol consumption, particularly targeted at young people and binge drinking
- Integrated health promotion campaigns promoting the consumption of the recommended levels of fruit and vegetables, inclusive of an expressed strategy to ensure proper nutrition in older age
- Public awareness of the adverse effects of excessive consumption of high-fat, highsalt, and high-sugar foods
- Culturally-appropriate and diverse programs to promote daily physical activity
- Include walk ways to improve physical activity in planning new road design in Chuuk
- Public awareness campaigns on the importance of regular monitoring and screening of blood pressure, blood cholesterol and blood sugar levels
- Public awareness programs targeted to increase awareness of the multipliers of NCD risk associated with combining the 5 major NCD risk factors (current daily smoking, being overweight, having raised blood pressure, eating less than five combined servings of fruit and vegetables per day, and having a low level of physical activity)
- A system of community-based care for the management of individuals with diagnosed NCDs

## 1. INTRODUCTION

### 1.1 Background and Rationale

In all countries, noncommunicable diseases (NCDs) are responsible for a high proportion of death and disability. In developing countries, the burden of disease caused by NCDs is increasing rapidly and there are significant social, economic, and health consequences for these countries. NCDs caused an estimated $60 \%$ of deaths in the world and $43 \%$ of the global burden of diseases in 1999. Based on current trends, by the year 2020 these diseases are predicted to account for $73 \%$ of deaths and $60 \%$ of the disease burden. Most of these increases will reflect the epidemiological transition in developing countries; from communicable to noncommunicable diseases. Unless increasing prevalence can be reversed the disability and dependency that accompanies NCDs will present an increasing burden on health facilities and on families.

Despite such observations that NCDs are an increasing health burden to the country, to date there is no in-depth knowledge of the prevalence of the common risk factors contributing to NCDs in the Chuuk State. In FSM, $75 \%$ of death was due to NCD ${ }^{1}$ There is a need for a clearer understanding of the production, trade, cultural and behavioural factors that contribute to NCDs in order to improve prevention and control programs.

This STEPS survey, being the first in Chuuk, provides a baseline for future STEPS surveys to assist in determining the effectiveness, or otherwise, of prevention and control measures. It also provides the basis for comparison with other countries. In the immediate term, this STEPS report provides information for national policy development, health education programs and health protection and promotion initiatives, as ultimately, the improvements in diet and physical activity and the control of risk laden consumptions are vested with the nation, the community and the individual.

### 1.2 The National Context

### 1.2.1 Geography

The Federated States of Micronesia (FSM) are located in Oceania, and comprise an island group in the North Pacific Ocean, about three-quarters of the way from Hawaii to Indonesia. Chuuk has a land area of 49 square miles and encompasses fifteen large islands, 192 outer islands and 80 islets. Chuuk State comprises 5 regions: North Namoneas, South Namoneas, Faichuk, Mortlock and Northwest. The weather is tropical with heavy year-round rainfall, especially in the eastern islands. Chuuk is located on southern edge of the typhoon belt and occasionally sustains severe damage, including landslides. The islands of Chuuk vary from mountainous islands with volcanic outcroppings to low coral atolls ${ }^{2}$.

### 1.2.2 Population and Living Environment

The populations of the 5 regions of Chuuk were estimated in 2010 to be 14,611 (30\%) in North Namoneas, 10,233 (21\%) in South Namoneas, 9,807 (20.2\%) in Faichuk, 7,181 (14.8\%) in Mortlock and 6,819 (14\%) in Northwest.

The 47,871 persons in Chuuk State in 1989 lived in 5,982 households, an average of 8.00 persons per household. The size of households in Chuuk is large even by Pacific Island standards, and is getting larger. Almost 3 out of every 10 households in Chuuk had 10 or more persons

### 1.2.3 Government, Culture and the Economy

Chuuk is one of four island states that comprise the Federated States of Micronesia, the other three being Pohnpei, Kosrae and Yap. FSM is a semi-independent nation under a Compact of Free Association with the United States allowing its citizens to work and live in the US. The compact and its subsidiary agreements commit the US to continue to provide, at no cost to the FSM, many services including defence, air safety, weather prediction, health services and assistance in the event of natural disasters until the end of the compact ${ }^{3}$.

Chuuk's GDP in 2007 was $\$ 53.6$ million with GDP per capita estimated to be $\$ 1,006$ annually ${ }^{4}$. Most (91.5\%) of households in Chuuk have a cash income, but average USD 6,195 per annum, less than other FSM Sates and rely to a large degree on subsistence farming and fishing.

The Chuukese language is within the Austronesian linguistic group. All 3 dialects in the Chuuk group are mutually understood. The extended family is the most common form of household, where fathers are the head and where first-born male children inherit the responsibilities of the father.

The nation's economic performance is still heavily dependent on government spending, funded by the Compact with the U.S. The industries of fisheries, tourism and commercial agriculture combined account for only a small percent of the total FSM economy. There is no manufacturing industry, although cold storage facilities and fish processing plants are in development. The main revenue earned from fishing has been from the annual license fees that FSM negotiates with outside nations wanting to fish in its waters, and fishing generates $85 \%$ of export revenue.

Tourism, the second targeted area of development, is constrained by high airfares and limited tourist facilities, but the potential exists for growth in this area ${ }^{5}$. Commercial agriculture accounts for only $1 \%$ of the economy ${ }^{6}$.

### 1.2.4 Noncommunicable Disease, Health Status and Health Infrastructure

The Chuuk State Department of Health and Hospital compiles information on hospital presentations and on morbidity and mortality. In 2009 the leading causes of morbidity included Diseases of the Respiratory System, Certain Infectious and Parasitic Diseases,

Diseases of the Skin and Subcutaneous Tissues, Diseases of the Musculoskeletal System and Connective Tissues and Diseases of the Circulatory System.

Leading causes of Mortality were Diseases of the Circulatory System, Diseases of Endocrine, Nutrition and Metabolism, Diseases of the Respiratory System, Neoplasms and Certain Infectious and Parasitic Diseases.

Premature adult mortality is high, with an average life expectancy of 66 years. The 2000 census estimated the following rates of birth, fertility, mortality and life expectancy indicate that Chuuk does not differ significantly from the other states of FSM.

| Indicator | All FSM | Chuuk State |
| :--- | ---: | ---: |
| Crude Birth Rate, per 1000 | 28.1 | 28.7 |
| Total Fertility Rate (TFR) | 4.44 | 4.51 |
| Crude Death Rate, per 1000 | 6.7 | 7.1 |
| Child Mortality Rate, per 1000 | 12 | 13 |
| Infant Mortality Rate | 40 | 43 |
| Life expectancy at birth | 67 | 66 |

Source: 2000 FSM Census
There are 65 public sector and 6 private sector health facilities in FSM, which include the only hospital at Weno (with 125 beds) and 64 Dispensaries. Each of the FSM States has a Department of Health that provides clinical services and coordinates public health programs comprising dispensaries and various vertical programs through municipal governments. The private sector services include 3 health clinics and 3 pharmacies. Medical referrals abroad are to the Philippines, Hawaii and Guam ${ }^{7}$.

The reliance on primary health care approaches challenges the nation to provide adequate services for the prevention and management of NCDs at the local level.

### 1.3 Developing WHO STEPS Survey in Chuuk State

Before this STEPS survey, no state-wide epidemiological data on NCD risk factors was collected in the State of Chuuk, Federated States of Micronesia. Recognizing the gap in knowledge on the magnitude of major NCDs and their risk factors for planning and policy development, STEPS survey was conducted in 2006.

## 2. OBJECTIVES

The overall aim of the NCD STEPS risk factor survey is to investigate the prevalence of key NCDs and their associated risk factors.

The STEPS survey:

- Documents the prevalence and magnitude of key NCDs among adults
- Documents the prevalence and magnitude of major modifiable risk factors for NCDs including smoking, alcohol consumption, poor eating patterns, physical inactivity, obesity, high blood pressure, raised blood glucose and cholesterol
- Compare NCDs and their risk factors by age and gender groups.

## 3. METHODOLOGY

### 3.1 Survey Structure

With the technical assistance of the FSM Census Office, the FSM (Chuuk) STEPS survey followed a sequential three-step process as follows (Figure 1):

Step 1: A questionnaire-based (interview) survey on tobacco use, betel nut use, alcohol drinking, fruit and vegetable consumption, and physical activity.

Step 2: Physiological measures of blood pressure, height, weight, hip and waist circumference.

Step 3: Biochemical measures of fasting blood glucose, total cholesterol and triglycerides.

Similar to other STEPS surveys conducted in the Pacific region, the Chuuk survey collected core information across all three steps. STEPS standardized survey methodology was followed. This approach ensures that Chuuk has available populationwide and representative data for between-country comparisons as well as within-country comparisons. In future surveys, Chuuk could add more questions or measurements to the core questions, depending on local needs.

$\begin{aligned} & \text { Biochemical } \\ & \text { measurements }\end{aligned}$
$\begin{aligned} & \text { Physical } \\ & \text { measurements }\end{aligned}$

Self report information

Figure 1. The WHO STEPwise approach to surveillance of NCD Risk Factors

### 3.2 Sample Size

The STEPS guidelines require a minimum sample size of 2000 participants, with at least 300 participants in each of 10 age-gender categories. Accordingly, 2,831 participants were selected from the age group 15-64 years to undergo STEP 1 and STEP 2. This
sample comprised 2,034 people in the age group 25-64 and 797 people in the age group $15-24$. Thirty precent of the sample aged $25-64$ was selected to participate in STEP 3 .

### 3.3 Data Collection Procedures

Survey personnel obtained informed consent from survey participants and gave fasting instructions to those randomly selected for STEP 3 (excluding the 15-24 age group) and made appointment times for those who consented to participate in the survey. All study in Chuuk followed the same procedure for selecting eligible participants.

Figure 2: Sequence of data collection and stations at the survey base

### 3.3.1 Registration of Participants

At the registration station, survey personnel:

- Confirmed consent of the participant to be involved in the survey
- Ensured that participants understood Step1, 2 and 3 involved in the survey
- Obtained participant date of birth and confirmed that they were within the target age group
- Confirmed fasting status of the participant
- Directed the participant to the appropriate station depending on the fasting status of the participant

### 3.3.2 Step 1 - Behavioural Risk Factors Interviews

All participants participated in a face-to-face interview in which questions were asked on smoking, alcohol and betel nut consumption, fruit and vegetable consumption, physical activity and history of chronic conditions and medications. Participants were also asked about the number of years they had participated in formal education.

### 3.3.3 Step 2 - Physical Measurements

Survey staff conducted the physical measurements following the recommended STEPwise protocols. The OMRON M4 Digital Automatic Blood Pressure Monitor was used to measure resting blood pressure. Blood pressure was measured three times; the first reading followed by two more measurements taken with 2-3 minute intervals. The three readings of the blood pressure were recorded, and the average of the second and third readings was used in the analysis.

Height and weight were measured once using the Seca Leicester Height Measure to the nearest whole centimeter and the Siltec PS500L to the nearest 0.1 kg , respectively. Participants were measured without shoes and wearing only light clothing. Waist and hip circumference was measured once using the Figure Finder constant tension tape and recorded to the nearest 0.1 cm . Waist circumference of female pregnant participants was not measured.

### 3.3.4 Step 3 - Biochemical Measurements

The survey included assessments of fasting blood glucose, fasting total cholesterol and triglycerides. Participants fasted from 10:00pm the previous night until 7:00am the following morning, when their capillary blood samples were drawn using the method of finger prick.

### 3.3.5 Check-out Station and Counseling

All participants received health advice and counseling and were provided with literature about smoking, alcohol drinking, obesity and nutrition, physical activity, hypertension, diabetes, and heart diseases. Participants who were identified as being at high risk of developing, or with, advanced chronic conditions were referred for a follow-up clinical examination.

### 3.4 Data Management and Analyses

### 3.4.1 Data Entry

Submitted questionnaires were checked randomly by staff to assess overall quality of data collection and completeness. Data entry was conducted by the survey staff at the Ministry of Health office using the EpiData software configured for double data entry function.

### 3.4.2 Data Weighting and Analysis

Post-stratification weights were calculated using the 2005 population projections based on Chuuk 2004 census of the population aged 15-64 years. Weighted sample means were computed for continuous variables. Frequency distributions were calculated using weighted frequencies for categorical variables. For both weighted frequency estimates and weighted means, $95 \%$ confidence intervals were reported by 10-year age groups and gender.

With support from the Division of Pacific Technical Support, WPRO/WHO Office in Suva, WHO Office in Geneva performed final data cleaning, data weighting, and analysis. Data analyses were conducted using the Epilnfo 2002 Version 3.5.1. The Division of Pacific Technical Support, WPRO/WHO Office in Suva compiled the whole Data Book.

In this report, main data tables present findings for those aged 25-64 years, following the standard age group reporting for WHO STEPS surveys. However, as data for the age group of 15-24 years was also collected, additional commentary is presented at the end of each section of behavioural risk factors.

## 4. RESULTS

### 4.1 Characteristics of Survey Population

The study randomly selected and invited 3,000 Chuuk Islanders aged 15-64 years to participate in the survey. A total of 2,831 individuals participated (response rate of 94.4\%). Data for those aged 25-64 years are reported here in the main tables, following the standard age group reporting for WHO STEPS surveys, and data for the age group $15-24$ are presented in a separate paragraph at the end of each section for Step 1.

Table 1 presents the age and gender distribution of the survey sample aged 25-64. More women respondents participated in the survey than men ( $64.6 \%$ and $35.4 \%$ ) respectively. The age range of the $25-64$ sample is close to being equally distributed across age groups.

Percentages given in the text relate to the age groups 25-64, and commentary on the $15-24$ age group is provided at the end of each section. Comparative reference is made to the findings of STEPwise surveys in Pohnpei ${ }^{8}$ within the Federated States of

Micronesia, and other Pacific island countries and areas in particular, Kiribati ${ }^{9}$, Cook Islands ${ }^{10}$ and the Solomon Islands ${ }^{11}$.

## Table 1 Demographic description of study population

| Age group and sex of respondents |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  | Women |  | Both Sexes |  |
|  | n | \% | n | \% | n | \% |
| 25-34 | 209 | 35.0 | 388 | 65.0 | 597 | 29.4 |
| 35-44 | 189 | 34.4 | 360 | 65.6 | 549 | 27.0 |
| 45-54 | 186 | 33.3 | 373 | 66.7 | 559 | 27.5 |
| 55-64 | 137 | 41.6 | 192 | 58.4 | 329 | 16.2 |
| 25-64 | 721 | 35.4 | 1313 | 64.6 | 2034 | 100.0 |

Table 2 presents the mean years of education of the survey respondents. Both genders and all age groups have similar mean years of education, with men having only marginally more years of education than women in age group 45-54. The oldest age group (55-64) of women reported the shortest mean years of education.

Table 2 Mean number of years education by gender and age group

| Mean number of years of education |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  | Women |  | Both Sexes |  |
|  | n | Mean | n | Mean | n | Mean |
| 25-34 | 205 | 9.7 | 379 | 9.5 | 584 | 9.6 |
| 35-44 | 187 | 9.5 | 355 | 9.2 | 542 | 9.3 |
| 45-54 | 185 | 10.3 | 370 | 9.5 | 555 | 9.8 |
| 55-64 | 134 | 9.6 | 186 | 7.4 | 320 | 8.3 |
| 25-64 | 711 | 9.8 | 1290 | 9.1 | 2001 | 9.4 |

### 4.2 Tobacco Use

Tobacco use was measured by asking participants if they currently smoke tobacco products. Respondents were categorized into the following smoking status:

- Current smokers - those who had smoked any tobacco product (such as cigarettes, cigars or rolled tobacco) in the past 12 months.
- Daily smokers - those who smoke any tobacco product every day.

> Non-daily smokers - those current smokers who do not smoke on a daily basis.

Table 3 shows that $32.4 \%$ of all respondents were current smokers. More than half of men ( $51 \% \pm 4.2$ ) were current smokers, compared to just $14 \% \pm 3.3$ of women respondents. This statistically significant gender difference was observed in all age groups. The highest proportion of current smokers among both genders was in the 35-44 years age group $(35.9 \% \pm 4.4)$ although this was due to the highest proportion of all male current smokers being in that age group. Among women, current smoking was highest in the 45-54 group.

Table 3 Percentage of current smokers in the study population

| Percentage of current smokers |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | \% Current smoker | 95\% CI | n | \% Current smoker | 95\% CI | n | \% Current smoker | $\begin{aligned} & 95 \% \\ & \mathrm{Cl} \end{aligned}$ |
| 25-34 | 206 | 52.9 | $\pm 5.7$ | 381 | 9.7 | $\pm 2.3$ | 587 | 31.7 | $\pm 4.3$ |
| 35-44 | 186 | 57.0 | $\pm 7.2$ | 358 | 16.2 | $\pm 5.8$ | 544 | 35.9 | $\pm 4.4$ |
| 45-54 | 186 | 48.9 | $\pm 5.9$ | 371 | 18.3 | $\pm 5.9$ | 557 | 33.7 | $\pm 4.6$ |
| 55-64 | 135 | 37.0 | $\pm 9.6$ | 192 | 13.0 | $\pm 5.9$ | 327 | 24.8 | $\pm 7.0$ |
| 25-64 | 713 | 51.0 | $\pm 4.2$ | 1302 | 14.0 | $\pm 3.3$ | 2015 | 32.4 | $\pm 3.2$ |

Table 4 shows that 49\% of male respondents were non-smokers. Of the balance (51\%) who smoked, $47 \% \pm 4$ smoked on a daily basis. More than half ( $52.7 \% \pm 6.7$ ) of men aged $35-44$ years were daily smokers. The proportion of daily smokers decreased thereafter to $35.6 \% \pm 8.4$ of daily smokers in the age group 55-64 years, as did the proportion of non-daily smokers.

Table 4 Current smoking status among men in the study population by age group

| Smoking status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  |  |  |  |  |
|  | n | Current smoker |  |  |  | $\begin{gathered} \text { \% Does } \\ \text { not } \\ \text { smoke } \end{gathered}$ | 95\% CI |
|  |  | \% Daily | 95\% CI | \% Nondaily | 95\% CI |  |  |
| 25-34 | 206 | 46.6 | $\pm 7.6$ | 6.3 | $\pm 3.6$ | 47.1 | $\pm 5.7$ |
| 35-44 | 186 | 52.7 | $\pm 6.7$ | 4.3 | $\pm 3.0$ | 43.0 | $\pm 7.2$ |
| 45-54 | 186 | 47.3 | $\pm 6.7$ | 1.6 | $\pm 2.3$ | 51.1 | $\pm 5.9$ |
| 55-64 | 135 | 35.6 | $\pm 8.4$ | 1.5 | $\pm 2.3$ | 63.0 | $\pm 9.6$ |
| 25-64 | 713 | 47.0 | $\pm 4.0$ | 4.0 | $\pm 1.7$ | 49.0 | $\pm 4.2$ |

Table 5 shows that $86 \%$ of the female respondents were non-smokers. Of the $14 \%$ who smoked $10.6 \% \pm 3.2$ smoked on a daily basis. The proportions of daily smokers increased with increasing age, from $5.2 \% \pm 2.7$ in the youngest age group (25-34 years) to $15.1 \% \pm 5.5$ in the age group ( $45-54$ years), while the proportion of non-daily smokers was unchanged in age groups 35-44 and 45-54 and decreased in age 55-64 years.

Table 5 Current smoking status among women in the study population by age group

| Smoking status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Women |  |  |  |  |  |  |
|  | n | Current smoker |  |  |  | $\begin{gathered} \text { \% Does } \\ \text { not } \\ \text { smoke } \\ \hline \end{gathered}$ | 95\% CI |
|  |  | \% Daily | 95\% CI | \% Nondaily | 95\% CI |  |  |
| 25-34 | 381 | 5.2 | $\pm 2.7$ | 4.5 | $\pm 1.8$ | 90.3 | $\pm 2.3$ |
| 35-44 | 358 | 13.1 | $\pm 5.2$ | 3.1 | $\pm 1.6$ | 83.8 | $\pm 5.8$ |
| 45-54 | 371 | 15.1 | $\pm 5.5$ | 3.2 | $\pm 1.8$ | 81.7 | $\pm 5.9$ |
| 55-64 | 192 | 11.5 | $\pm 5.3$ | 1.6 | $\pm 1.9$ | 87.0 | $\pm 5.9$ |
| 25-64 | 1302 | 10.6 | $\pm 3.2$ | 3.4 | $\pm 1.2$ | 86.0 | $\pm 3.3$ |

Table 6 presents the prevalence of daily smokers, non-daily smokers and non-smokers for men and women combined. Overall, $28.7 \% \pm 3$ of survey respondents were daily smokers, $3.7 \% \pm 1.1$ were non-daily smokers and $67.6 \% \pm 3.2$ were non-smokers. The highest proportion of daily smokers ( $32.2 \% \pm 4.4$ ) was among men in age group $35-44$, and this was essentially sustained through age group 45-54 (31.3\% $\pm 4.9$ ).

Table 6 Current smoking status among both sexes in the study population by age group

| Smoking status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Both Sexes |  |  |  |  |  |  |
|  | n | Current smoker |  |  |  | $\begin{gathered} \text { \% Does } \\ \text { not } \\ \text { smoke } \end{gathered}$ | 95\% CI |
|  |  | \% Daily | 95\% CI | \% Nondaily | 95\% CI |  |  |
| 25-34 | 587 | 26.3 | $\pm 4.9$ | 5.4 | $\pm 1.9$ | 68.3 | $\pm 4.3$ |
| 35-44 | 544 | 32.2 | $\pm 4.4$ | 3.7 | $\pm 1.6$ | 64.1 | $\pm 4.4$ |
| 45-54 | 557 | 31.3 | $\pm 4.9$ | 2.4 | $\pm 1.6$ | 66.3 | $\pm 4.6$ |
| 55-64 | 327 | 23.3 | $\pm 5.9$ | 1.5 | $\pm 1.4$ | 75.2 | $\pm 7.0$ |
| 25-64 | 2015 | 28.7 | $\pm 3.0$ | 3.7 | $\pm 1.1$ | 67.6 | $\pm 3.2$ |

Table 7 shows that among current daily smokers, the mean age of starting smoking for men was $17.2 \pm 0.7$ years and for women was $21.6 \pm 1.9$ years. This gender difference of women reporting uptake at an older age occurs in all age groups. Across both sexes, the youngest cohort of 25-34 years reported uptake earlier than the older cohorts. The highest mean age of smoking uptake ( $28.2 \pm 7.5$ ) was reported among women in age groups 55-64.

Table 7 Mean age started smoking among current daily smokers

| Mean age started smoking |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age | Men |  |  | Women |  |  | Both Sexes |  |  |
| Group (years) | n | Mean age | 95\% CI | n | Mean age | 95\% CI | n | Mean age | $\begin{aligned} & \hline 95 \% \\ & \mathrm{Cl} \\ & \hline \end{aligned}$ |
| 25-34 | 90 | 16.6 | $\pm 0.9$ | 18 | 18.8 | $\pm 1.6$ | 108 | 16.8 | $\pm 0.9$ |
| 35-44 | 93 | 17.2 | $\pm 0.9$ | 43 | 20.7 | $\pm 2.2$ | 136 | 17.9 | $\pm 1.0$ |
| 45-54 | 85 | 17.9 | $\pm 1.7$ | 53 | 21.2 | $\pm 1.6$ | 138 | 18.7 | $\pm 1.2$ |

Table 8 shows that among current daily smokers overall, the mean number of years of smoking was $22.9 \pm 1$ years. Men reported smoking for a mean of $23 \pm 1.1$ years and women for a mean of $22.3 \pm 2.4$ years. Respondents in age group $55-64$ reported a mean duration of smoking as $40.6 \pm 2.3$ years for men and $29.8 \pm 7.7$ years for women.

Table 8 Mean number of years of smoking among current daily smokers

| Mean duration of smoking |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean duration | 95\% CI | n | Mean duration | 95\% CI | n | Mean duration | $\begin{aligned} & 95 \% \\ & \mathrm{Cl} \end{aligned}$ |
| 25-34 | 90 | 12.9 | $\pm 0.9$ | 18 | 10.7 | $\pm 2.0$ | 108 | 12.7 | $\pm 0.8$ |
| 35-44 | 93 | 22.9 | $\pm 1.1$ | 43 | 19.3 | $\pm 2.2$ | 136 | 22.2 | $\pm 1.1$ |

Table 9 shows that manufactured cigarettes were commonly smoked by current daily smokers: $84.5 \% \pm 4.6$ of men and $82 \% \pm 6.2$ of women. The smoking of manufactured cigarettes was high in all age groups of both genders, the lowest occurring among men age 45-54.

Table 9 Percentage of current daily smokers who smoke manufactured cigarettes

| Manufactured cigarette smokers among daily smokers |  |  |  |  |  |  |  |  |  |

| 45-54 | 88 | 77.3 | $\pm 8.4$ | 56 | 82.1 | $\pm 10.7$ | 144 | 78.4 | $\pm 6.6$ |
| 55-64 | 48 | 89.6 | $\pm 7.1$ | 22 | 81.8 | $\pm 13.4$ | 70 | 87.6 | $\pm 7.3$ |
| 25-64 | 330 | 84.5 | $\pm 4.6$ | 145 | 82.0 | $\pm 6.2$ | 475 | 84.1 | $\pm 3.9$ |

Among those aged 15 - 24 years, $27.6 \% \pm 4.6$ were current smokers ( $45.8 \% \pm 7.1$ male and $7.7 \% \pm 2.7$ female). Among the total population aged $15-24,35.1 \% \pm 6.8$ of males and $2.6 \% \pm 1.4$ of females reported smoking on a daily basis, averaging to $19.6 \% \pm 3.9$ for the overall population. Males aged $15-24$ reported started smoking at age $15.4 \pm 0.6$ years and having smoked for a mean of $5 \pm 0.6$ years. Women reported starting at age $16.9 \pm 0.9$ years and having smoked for a mean of $3.6 \pm 1.9$ years. Notably, the age of smoking uptake in both genders of this age group was younger than in older cohorts. The majority ( $83.4 \% \pm 6.7$ ) of the population in age group $15-24$ smoked manufactured cigarettes, similar to all other age groups.

### 4.3 Betel Nut Use

Table 10 shows that $68.2 \% \pm 7.0$ of male respondents were abstainers from chewing betel nut. Of the $31.8 \% \pm 7.0$ of men who chewed betel nut in the past 12 months the largest proportion $(59.5 \% \pm 10.8)$ was in the age group $25-34$. Rates of betel nut use among men declined significantly in subsequent age groups.

Table 10 Percentage of current betel nut chewers among men during the past 12 months by age group

| Betel nut chewing status |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  |  |  |
|  | n | \% Chewed in last 12 months | 95\% CI | \% Abstainer | 95\% CI |
| 25-34 | 205 | 59.5 | $\pm 10.8$ | 40.5 | $\pm 10.8$ |
| 35-44 | 186 | 23.7 | $\pm 7.9$ | 76.3 | $\pm 7.9$ |
| 45-54 | 185 | 11.4 | $\pm 4.8$ | 88.6 | $\pm 4.8$ |
| 55-64 | 137 | 7.3 | $\pm 5.7$ | 92.7 | $\pm 5.7$ |
| 25-64 | 713 | 31.8 | $\pm 7.0$ | 68.2 | $\pm 7.0$ |

Table 11 shows that $86.7 \% \pm 2.5$ of female respondents were abstainers from chewing betel nut. Of the $13.3 \% \pm 2.5$ of women who chewed betel nut in the past 12 months the largest proportion $(29.4 \% \pm 5)$ was in the age group 25-34. Rates of betel nut use among females declined significantly thereafter.

Table 11 Percentage of current betel nut chewers among women during the past 12 months by age group

| Betel nut chewing status |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | \% Chewed in <br> last 12 months | Women |  |  |

| $25-64$ | 1303 | 13.3 | $\pm 2.5$ | 98.4 | $\pm 1.8$ |

Table 12 shows that $77.5 \% \pm 3.9$ of all respondents were abstainers from chewing betel nut. Of the $22.5 \% \pm 3.9$ who chewed betel nut in the past 12 months the largest proportion ( $44.6 \% \pm 6.4$ ) was in the age group $25-34$. Rates of betel use declined significantly for both sexes in subsequent age groups.

Table 12 Percentage of current betel nut chewers among both sexes during the past 12 months by age group

| Betel nut chewing status |  |  |  |  |  |

Table 13 presents the current prevalence of daily betel nut users, non-daily users and non-users among men. Overall, $17.7 \% \pm 4.7$ of male respondents were daily chewers, $14.1 \% \pm 3.2$ were non-daily chewers and $68.2 \% \pm 7$ were non-betel nut chewers. The highest proportion of daily betel nut chewers $(36.6 \% \pm 8.1)$ was reported in the age group 25-34.

Table 13 Current chewing status among men in the study population by age group

| 55-64 | 191 | 0.5 | $\pm 1.1$ | 1.0 | $\pm 1.5$ | 98.4 | $\pm 1.8$ |
| 25-64 | 1303 | 8.1 | $\pm 2.8$ | 5.2 | $\pm 1.6$ | 86.7 | $\pm 2.5$ |

Table 15 presents the current prevalence of daily betel users, non-daily users and nonusers among both men and women combined. Overall, $77.5 \% \pm 3.9$ were non-betel nut users, $12.8 \% \pm 2.5$ were daily chewers, $9.7 \% \pm 2.1$ were non-daily chewers. The highest proportion of daily betel nut chewers $(28.1 \% \pm 4.6)$ was reported in the age group 25-34.

Table 15 Current chewing status among both sexes in the study population by age group

| Chewing status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Both Sexes |  |  |  |  |  |  |
|  | n | Current chewer |  |  |  | \% Does not chew | 95\% CI |
|  |  | \% Daily | 95\% CI | \% Non daily | 95\% Cl |  |  |
| 25-34 | 589 | 28.1 | $\pm 4.6$ | 16.5 | $\pm 4.1$ | 55.4 | $\pm 6.4$ |
| 35-44 | 543 | 6.4 | $\pm 2.6$ | 9.0 | $\pm 3.2$ | 84.7 | $\pm 4.2$ |
| 45-54 | 556 | 2.7 | $\pm 2.4$ | 4.1 | $\pm 1.8$ | 93.2 | $\pm 2.9$ |
| 55-64 | 328 | 2.1 | $\pm 1.9$ | 2.3 | $\pm 1.6$ | 95.6 | $\pm 2.9$ |
| 25-64 | 2016 | 12.8 | $\pm 2.5$ | 9.7 | $\pm 2.1$ | 77.5 | $\pm 3.9$ |

Among those aged $15-24,65.8 \% \pm 8.2$ of males and $42.7 \% \pm 6.2$ of females were current betel nut chewers, giving and average of $54.8 \% \pm 4.8$ overall. Almost half ( $49.7 \% \pm 8.6$ ) of males and $31.8 \% \pm 5.2$ of females chewed betel nuts on a daily basis, averaging to $41.2 \% \pm 4.7$ overall.

### 4.4 Alcohol Consumption

This section describes patterns of alcohol consumption in Chuuk. To assess patterns and prevalence of alcohol consumption, respondents were asked if they ever consumed alcohol, and the frequency and quantity of alcohol consumed. Those who had consumed an alcoholic drink in the past 12 months were classified as current drinkers. Tables 1618 summarise the prevalence of alcohol consumption during the past 12 months among men, women and both sexes respectively.

There was a statistically significant gender difference in alcohol consumption behavior, with more than a third of males ( $34.3 \% \pm 5.9$ ) (Table 16) and just over $1 \%$ of females ( $1.3 \% \pm 0.6$ ) (Table 17) classified as current drinkers.

Among male current drinkers the largest proportion ( $43.3 \% \pm 8.6$ ) occurs in the age group 25-34 and declines thereafter.

Table 16 Percentage of alcohol consumption among men during the past 12 months by age group

| Alcohol consumption status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Men |  |  |  |  |  |  |
| Age Group (years) | n | \% Lifetime Abstainer | 95\% CI | $\begin{aligned} & \% \text { Past } 12 \\ & \text { mos. } \\ & \text { abstainer } \end{aligned}$ | 95\% CI | \% current drinker (drank in past 12 mos.) | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ |
| 25-34 | 208 | 37.0 | $\pm 9.8$ | 19.7 | $\pm 7.8$ | 43.3 | $\pm 8.6$ |
| 35-44 | 186 | 39.2 | $\pm 8.9$ | 24.7 | $\pm 8.6$ | 36.0 | $\pm 8.4$ |
| 45-54 | 184 | 45.1 | $\pm 9.7$ | 27.2 | $\pm 8.3$ | 27.7 | $\pm 7.3$ |
| 55-64 | 137 | 51.1 | $\pm 7.6$ | 32.1 | $\pm 9.1$ | 16.8 | $\pm 7.2$ |
| 25-64 | 715 | 41.3 | $\pm 7.0$ | 24.4 | $\pm 5.8$ | 34.3 | $\pm 5.9$ |

Among female current drinkers the largest proportion ( $3.4 \% \pm 1.5$ ) occurs in the age group 25-34, declines significantly thereafter and ceases in age groups 45-54 and over.

Table 17 Percentage of alcohol consumption among women during the past 12 months by age group

| Alcohol consumption status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Women |  |  |  |  |  |  |
| Age <br> Group <br> (years) | n | \% Lifetime <br> Abstainer | $95 \% \mathrm{Cl}$ | \% Past 12 <br> mos. <br> abstainer | $95 \% \mathrm{Cl}$ | \% current <br> drinker <br> (drank in <br> past 12 <br> mos.) | $95 \% \mathrm{Cl}$ |
| $25-34$ | 383 | 93.2 | $\pm 2.7$ | 3.4 | $\pm 2.1$ | 3.4 | $\pm 1.5$ |
| $35-44$ | 358 | 98.6 | $\pm 1.2$ | 1.1 | $\pm 1.1$ | 0.3 | $\pm 0.6$ |
| $45-54$ | 367 | 96.5 | $\pm 2.3$ | 3.5 | $\pm 2.3$ | ---- | $\pm 0.0$ |
| $55-64$ | 191 | 99.5 | $\pm 1.0$ | 0.5 | $\pm 1.0$ | --- | $\pm 0.0$ |
| $25-64$ | 1299 | 96.3 | $\pm 1.3$ | 2.4 | $\pm 1.0$ | 1.3 | $\pm 0.6$ |

Table 18 shows that consistent in all age groups more than two thirds $(68.9 \% \pm 3.9)$ of the population reported being lifetime abstainers from alcohol. The highest proportion of current drinkers among both genders was in the $25-34$ years age group ( $23.7 \% \pm 3.3$ ). Thereafter, the proportion of current drinkers decreased with increasing age.

## Table 18 Percentage of alcohol consumption among both sexes during the past 12 months by age group

| Alcohol consumption status |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Both Sexes |  |  |  |  |  |  |
| Age Group (years) | n | \% Lifetime Abstainer | 95\% CI | \% Past 12 mos. abstainer | 95\% CI | \% current drinker (drank in past 12 mos.) | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ |
| 25-34 | 591 | 64.6 | $\pm 6.6$ | 11.7 | $\pm 4.3$ | 23.7 | $\pm 5.5$ |
| 35-44 | 544 | 70.0 | $\pm 5.4$ | 12.5 | $\pm 4.4$ | 17.5 | $\pm 4.4$ |
| 45-54 | 551 | 70.6 | $\pm 5.0$ | 15.4 | $\pm 4.2$ | 13.9 | $\pm 3.8$ |
| 55-64 | 328 | 75.5 | $\pm 4.5$ | 16.2 | $\pm 4.7$ | 8.3 | $\pm 3.6$ |
| 25-64 | 2014 | 68.9 | $\pm 3.9$ | 13.4 | $\pm 2.9$ | 17.7 | $\pm 3.3$ |

Table 19 presents information on current drinkers by the frequency (number of drinking days) of alcohol consumption, quantity of drinks consumed (number of drinks on any drinking day) and the proportion of the sample that drank more than 20 alcoholic drinks in the past 7 days. It shows that among male current drinkers $(9.4 \% \pm 4.5)$ consumed alcohol on 4 of the past 7 days, almost half $(49.6 \% \pm 5.4)$ consumed 5 or more drinks on any drinking day and $16.7 \% \pm 5$ drank 20 or more drinks over a 7 day period. The highest proportions of males who drank 5 or more standard drinks on any day were in the age groups $55-64(65 \% \pm 19.4)$ and $45-54(55.6 \% \pm 14.2)$.

Table 19 Frequency and quantity of drinks consumed in the last 7 days by current (last 30 days) drinker, grouped into three categories

| Frequency and quantity of drinks consumed in the last 7 days |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | \% Drank <br> on 4+ <br> days | $95 \% \mathrm{Cl}$ | Men <br> drinks on <br> any day | $95 \% \mathrm{Cl}$ | $\% 20+$ <br> drinks in 7 <br> days | $95 \%$ <br> Cl |
| $25-34$ | 60 | 16.7 | $\pm 7.7$ | 46.7 | $\pm 10.7$ | 16.7 | $\pm 8.1$ |
| $35-44$ | 46 | 2.2 | $\pm 4.1$ | 45.7 | $\pm 14.0$ | 15.2 | $\pm 10.9$ |
| $45-54$ | 36 | 2.8 | $\pm 5.2$ | 55.6 | $\pm 14.2$ | 19.4 | $\pm 9.7$ |
| $55-64$ | 20 | 10.0 | $\pm 12.2$ | 65.0 | $\pm 19.4$ | 15.0 | $\pm 13.1$ |
| $25-64$ | 162 | 9.4 | $\pm 4.5$ | 49.6 | $\pm 5.4$ | 16.7 | $\pm 5.0$ |

Table 20 presents information on the number of standard drinks consumed per drinking day by male current drinkers (average of $10.3 \pm 1.1$ standard drinks) on a drinking day and shows that heavy drinking is common among all age groups from $35-64$ but is most common among older men in age group 55-64.

Table 20 Number of drinks per day among men who are current drinkers by age group

| Number of standard drinks consumed on a drinking day |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Men |  |  |  |  |  |  |  |  |  |  |
| Age <br> Group (years) | n | \% 1 <br> drink | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | \% 2-3 drinks | 95\% CI | \% 4-5 <br> drinks | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% 6+ drinks | 95\% CI | ```Mean # of standard drinks``` | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| 25-34 | 82 | 3.7 | $\pm 4.0$ | 13.4 | $\pm 10.2$ | 11.0 | $\pm 6.7$ | 72.0 | $\pm 11.8$ | 9.5 | $\pm 1.7$ |
| 35-44 | 56 | 1.8 | $\pm 3.5$ | 3.6 | $\pm 5.2$ | 10.7 | $\pm 7.5$ | 83.9 | $\pm 10.5$ | 10.4 | $\pm 1.7$ |
| 45-54 | 50 | 2.0 | $\pm 4.2$ | 6.0 | $\pm 7.0$ | 10.0 | $\pm 8.4$ | 82.0 | $\pm 9.5$ | 11.1 | $\pm 2.5$ |
| 55-64 | 21 | ---- | $\pm 0.0$ | ---- | $\pm 0.0$ | ---- | $\pm 0.0$ | 100.0 | $\pm 0.0$ | 13.4 | $\pm 3.1$ |
| 25-64 | 209 | 2.6 | $\pm 2.3$ | 8.5 | $\pm 4.4$ | 10.0 | $\pm 3.6$ | 78.9 | $\pm 5.3$ | 10.3 | $\pm 1.1$ |

Table 21 shows that current drinkers of both genders combined drink an average of 10.1 $\pm 1$ standard drinks on a drinking day, but with the low number of females in the sample of current drinkers the overall population averages just below the male rate.

Table 21 Number of drinks per day among both sexes who are current drinkers by age group

| Number of standard drinks consumed on a drinking day |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Both Sexes |  |  |  |  |  |  |  |  |  |  |
| Age Group (years) | n | \% 1 drink | 95\% CI | \% 2-3 drinks | 95\% CI | \% 4-5 <br> drinks | 95\% CI | \% 6+ drinks | 95\% CI | Mean \# of standar d drinks | 95\% CI |
| 25-34 | 93 | 5.2 | $\pm 4.6$ | 14.3 | $\pm 9.3$ | 11.4 | $\pm 6.6$ | 69.0 | $\pm 11.8$ | 9.1 | $\pm 1.6$ |
| 35-44 | 57 | 1.8 | $\pm 3.5$ | 3.5 | $\pm 5.2$ | 10.6 | $\pm 7.4$ | 84.1 | $\pm 10.3$ | 10.5 | $\pm 1.6$ |
| 45-54 | 51 | 2.0 | $\pm 4.2$ | 6.9 | $\pm 7.1$ | 9.9 | $\pm 8.3$ | 81.2 | $\pm 9.3$ | 11.0 | $\pm 2.4$ |
| 55-64 | 21 | ---- | $\pm 0.0$ | ---- | $\pm 0.0$ | ---- | $\pm 0.0$ | 100.0 | $\pm 0.0$ | 13.4 | $\pm 3.1$ |
| 25-64 | 222 | 3.4 | $\pm 2.5$ | 9.3 | $\pm 4.0$ | 10.2 | $\pm 3.4$ | 77.1 | $\pm 5.2$ | 10.1 | $\pm 1.0$ |

Among those aged $15-24,31.5 \% \pm 7.2$ of males and $2.7 \% \pm 1.4$ of females were current drinkers. Among males, $12.3 \% \pm 8.7$ consumed alcohol on 4 of the past 7 days, $60.4 \%$ $\pm 14.6$ consumed $6+$ drinks on any drinking day and $15.1 \% \pm 7.2$ drank $20+$ standard drinks in the past 7 days. Both sexes combined consumed an average of $8.5 \pm 1.3$ standard drinks on a drinking day, although not statistically less than the average for all older age groups.

### 4.5 Intake of Fruit and Vegetables

Respondents' fruit and vegetable intake was assessed by asking how many days they consumed fruit and vegetables in a typical week, and how many servings of each they consumed on one of those days. Table 22 shows that men and women reported similar mean days of fruit consumed in a typical week ( $2.6 \pm 0.2$ ) overall and across all age groups.

Table 22 Mean number of days in a week that fruits are consumed by gender and age group

| Mean number of days fruit consumed in a typical week |  |  |  |  |  |  |  |  |  |

Table 27 shows that $90.4 \% \pm 1.8$ of respondents of both genders consumed less than five combined servings of fruit and vegetables on an average day with no difference between men $(91.4 \% \pm 2.3$ ) and women ( $89.4 \% \pm 2.5$ ), although males in age group 5564 presented the highest proportion of those eating less than 5 combined servings per average day.

Table 27 Percentage who consumed less than five combined servings of fruit and vegetables per day of the week

| Less than five servings of fruit and vegetables on average per day |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | $\%$ < five servings per day | 95\% CI | n | $\%$ < five servings per day | 95\% CI | n | \% < five servings per day | $\begin{aligned} & 95 \% \\ & \mathrm{CI} \end{aligned}$ |
| 25-34 | 202 | 92.6 | $\pm 2.8$ | 376 | 90.4 | $\pm 3.5$ | 578 | 91.5 | $\pm 2.3$ |
| 35-44 | 186 | 89.2 | $\pm 5.5$ | 351 | 88.3 | $\pm 4.9$ | 537 | 88.8 | $\pm 3.4$ |
| 45-54 | 180 | 90.6 | $\pm 4.3$ | 367 | 89.6 | $\pm 3.3$ | 547 | 90.1 | $\pm 2.8$ |
| 55-64 | 136 | 94.1 | $\pm 3.8$ | 189 | 88.4 | $\pm 5.9$ | 325 | 91.2 | $\pm 3.8$ |
| 25-64 | 704 | 91.4 | $\pm 2.3$ | 1283 | 89.4 | $\pm 2.5$ | 1987 | 90.4 | $\pm 1.8$ |

Those aged 15-24 consumed fruit and vegetables at similar rates to the other age groups and showed similar proportions of those receiving less than 5 combined servings of fruit and vegetables on an average day.

### 4.6 Physical Activity

### 4.6.1 Measurements

In Step 1 respondents were asked how often (frequency) and how long (duration) they engaged in three domains of physical activity in a typical week: work-related, transportrelated and leisure-related. In the work and leisure domains, respondents were asked how many days per week and how many hours/minutes per day they participate in
moderate and vigorous intensity activities. In the transport domain, respondents were asked how often and how long they either walk and/or cycle to and from places.

### 4.6.2 Analysis

The three physical activity domains were first examined separately to determine the proportion of activity undertaken in each domain as a component of total physical activity. For each domain, three levels of activity were recorded: low, moderate, and high. In each domain, the total time participants spent in an activity per 7 day week was computed by multiplying the number of days by the duration of the activity. To account for the different levels of energy expenditure required for the activities (i.e. low, moderate or high), the daily duration of activity was converted into METminutes per week. The term MET (metabolic equivalent) is used as an indication of the intensity of physical activity. A MET is the ratio of the associated metabolic rate for a specific activity divided by the resting metabolic rate. The energy cost of sitting is equivalent to a resting metabolic rate of 1 MET.

In this report, the following MET values were allocated to the three physical activity domains:

$$
\begin{array}{ll}
\text { Moderate physical activity (work and leisure domain) } & =4.0 \mathrm{METS} \\
\text { High physical activity (work and leisure domain) } & =8.0 \mathrm{METS} \\
\text { Travel related walking/cycling } & =4.0 \mathrm{METS}
\end{array}
$$

The following levels of activity in terms of METminutes were defined as:

| Low activity: | $<600$ METminutes per week |
| :--- | :--- |
| Moderate activity: | $600-1500$ METminutes per week |
| High activity: | $>1500$ METminutes per week |

### 4.6.3 Levels of Physical Activity

Table 28 shows that when physical activity done as part of work, transport and leisure time is combined $58.6 \% \pm 6.2$ of men reported a low level of total physical activity. Moderate physical activity was reported by $9.8 \% \pm 2.4$ of men and a high level of physical was reported by $31.6 \% \pm 5.8$. The proportions of low total physical activity increased in age group 45-54, while the proportions reporting moderate and high levels of physical activity varied little, although a high level of total physical activity decreased in age group 45-54 and further decreased in age group 55-64.

Table 28 Categories of overall physical activity among men by age group

| Level of total physical activity |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | \% Low | $95 \% \mathrm{Cl}$ | Men <br> Moderate | $95 \% \mathrm{Cl}$ | $\%$ High | $95 \% \mathrm{Cl}$ |
| $25-34$ | 188 | 56.4 | $\pm 6.6$ | 10.1 | $\pm 4.1$ | 33.5 | $\pm 8.3$ |
| $35-44$ | 170 | 52.9 | $\pm 8.9$ | 9.4 | $\pm 3.4$ | 37.6 | $\pm 7.6$ |
| $45-54$ | 170 | 63.5 | $\pm 10.7$ | 8.2 | $\pm 5.4$ | 28.2 | $\pm 9.4$ |
| $55-64$ | 125 | 67.2 | $\pm 9.9$ | 12.8 | $\pm 6.2$ | 20.0 | $\pm 7.3$ |
| $25-64$ | 653 | 58.6 | $\pm 6.2$ | 9.8 | $\pm 2.4$ | 31.6 | $\pm 5.8$ |

Table 29 shows that when physical activity done as part of work, transport and leisure time is combined $67.5 \% \pm 4.9$ of women reported a low level of total physical activity. Moderate physical activity was reported by $12.5 \% \pm 2.2$ of women and a high level of physical was reported by $20.1 \% \pm 3.9$. The proportions of low total physical activity varied little among the age groups of women. A high level of total physical activity decreased in the age group 55-64.

Table 29 Categories of overall physical activity among women by age group

| Level of total physical activity |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | \% Low | $95 \% \mathrm{Cl}$ | Women <br> Moderate | $95 \% \mathrm{Cl}$ | \% High | $95 \% \mathrm{Cl}$ |
| $25-34$ | 358 | 69.6 | $\pm 4.7$ | 10.9 | $\pm 3.2$ | 19.6 | $\pm 4.2$ |
| $35-44$ | 336 | 65.5 | $\pm 7.2$ | 13.4 | $\pm 4.2$ | 21.1 | $\pm 6.3$ |
| $45-54$ | 350 | 64.9 | $\pm 7.1$ | 13.7 | $\pm 3.5$ | 21.4 | $\pm 6.2$ |
| $55-64$ | 166 | 71.1 | $\pm 8.9$ | 12.7 | $\pm 5.3$ | 16.3 | $\pm 7.3$ |
| $25-64$ | 1210 | 67.5 | $\pm 4.9$ | 12.5 | $\pm 2.2$ | 20.1 | $\pm 3.9$ |

Table 30 shows that when physical activity done as part of work, transport and leisure time is combined almost two thirds $(63.1 \% \pm 4.9)$ of both genders reported a low level of total physical activity. Moderate physical activity was reported by $11.2 \% \pm 1.7$ and a high level of physical was reported by $25.8 \% \pm 4.4$. The proportions of low total physical activity increased and high activity decreased in age group 45-54 and again in age group 55-64, while the proportions reporting a moderate level of physical activity changed little.

Table 30 Categories of overall physical activity among both sexes by age group

| Level of total physical activity |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | $\%$ Low | $95 \% \mathrm{Cl}$ | Both Sexes <br> Moderate | $95 \% \mathrm{Cl}$ | $\%$ High | $95 \% \mathrm{Cl}$ |
|  | $25-34$ | 546 | 63.0 | $\pm 5.0$ | 10.5 | $\pm 2.3$ | 26.5 |
| $35-44$ | 506 | 59.5 | $\pm 6.2$ | 11.5 | $\pm 2.6$ | 29.0 | $\pm 5.3$ |
| $45-54$ | 520 | 64.2 | $\pm 6.9$ | 11.0 | $\pm 3.0$ | 24.8 | $\pm 5.9$ |
| $55-64$ | 291 | 69.1 | $\pm 7.6$ | 12.7 | $\pm 4.0$ | 18.2 | $\pm 5.9$ |
| $25-64$ | 1863 | 63.1 | $\pm 4.9$ | 11.2 | $\pm 1.7$ | 25.8 | $\pm 4.4$ |

Table 31 presents the mean minutes of total physical activity across all three domains per day by gender and age. Overall, respondents reported an average of $85.6 \pm 13.7$ mean minutes per day spent in total physical activity, although there was a statistically significant gender difference with men engaged in physical activity for a mean of 104.3 $\pm 18.2$ minutes per day and women for a mean of $67.4 \pm 11$ minutes per day. In both sexes physical activity peaked in the $35-44$ groups and declined thereafter.

Table 31 Level of total physical activity (mean minutes per day) by gender and age group

| Mean minutes of total physical activity on average per day |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 25-34 | 188 | 105.7 | $\pm 22.0$ | 358 | 65.4 | $\pm 15.7$ | 546 | 85.6 | $\pm 16.6$ |
| 35-44 | 170 | 123.2 | $\pm 32.1$ | 336 | 77.1 | $\pm 20.4$ | 506 | 99.0 | $\pm 18.0$ |
| 45-54 | 170 | 91.9 | $\pm 28.2$ | 350 | 68.1 | $\pm 15.6$ | 520 | 79.9 | $\pm 17.1$ |
| 55-64 | 125 | 84.1 | $\pm 28.2$ | 166 | 49.0 | $\pm 17.6$ | 291 | 66.8 | $\pm 19.9$ |
| 25-64 | 653 | 104.3 | $\pm 18.2$ | 1210 | 67.4 | $\pm 11.0$ | 1863 | 85.6 | $\pm 13.7$ |

Tables 32-34 present results on mean minutes per day engaged in work-related (Table 32) transport-related (Table 33) and recreation-related (Table 34) physical activity. Overall, and in both sexes, work accounted for the greatest part of all physical activity followed by transport and recreation.

Table 32 shows that work-related physical activities comprised $70.1 \pm 13$ mean minutes/day for men and $48.7 \pm 9$ mean minutes/day for women. Across all age groups men reported engaging in more mean minutes of work-related physical activity than women.

Table 32 Level of work-related physical activity (mean minutes per day) by gender and age group

| Mean minutes of work-related physical activity on average per day |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 25-34 | 188 | 27.5 | $\pm 9.2$ | 358 | 14.6 | $\pm 3.7$ | 546 | 21.0 | $\pm 5.7$ |
| 35-44 | 170 | 29.3 | $\pm 9.6$ | 336 | 17.8 | $\pm 3.9$ | 506 | 23.3 | $\pm 4.8$ |
| 45-54 | 170 | 21.0 | $\pm 7.6$ | 350 | 18.6 | $\pm 4.7$ | 520 | 19.8 | $\pm 4.1$ |
| 55-64 | 125 | 20.4 | $\pm 10.6$ | 166 | 18.6 | $\pm 7.9$ | 291 | 19.5 | $\pm 8.3$ |
| 25-64 | 653 | 25.5 | $\pm 6.8$ | 1210 | 16.9 | $\pm 2.5$ | 1863 | 21.2 | $\pm 4.2$ |

Table 34 shows that recreation-related physical activities comprised $8.7 \pm 3.7$ mean minutes/day for men and $1.7 \pm 1$ mean minutes/day for women. In all age groups men reported engaging in more mean minutes/day of recreation related physical activity than women.

Table 34 Level of recreation-related physical activity (mean minutes per day) by gender and age group

| Mean minutes of recreation-related physical activity on average per day |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean minutes | 95\% CI | n | Mean Minutes | 95\% CI | n | Mean minutes | $\begin{gathered} \hline 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| 25-34 | 188 | 12.2 | $\pm 5.5$ | 358 | 2.9 | $\pm 2.2$ | 546 | 7.6 | $\pm 3.2$ |
| 35-44 | 170 | 9.4 | $\pm 7.7$ | 336 | 2.0 | $\pm 2.3$ | 506 | 5.5 | $\pm 3.9$ |
| 45-54 | 170 | 6.0 | $\pm 5.1$ | 350 | 0.5 | $\pm 0.4$ | 520 | 3.2 | $\pm 2.6$ |
| 55-64 | 125 | 2.0 | $\pm 2.8$ | 166 | 0.0 | $\pm 0.1$ | 291 | 1.0 | $\pm 1.4$ |
| 25-64 | 653 | 8.7 | $\pm 3.7$ | 1210 | 1.7 | $\pm 1.0$ | 1863 | 5.1 | $\pm 2.1$ |

Among those aged $15-24$ years, $63.3 \% \pm 6.3$ of males reported a low level of physical activity as did $71.2 \% \pm 5.7$ of females. Males reported more mean minutes of total physical activity than females ( $70.3 \pm 16.2$ mean minutes and $52.6 \pm 15.8$ respectively) largely due to more recreation-related activity.

### 4.7 Overweight and Obesity

### 4.7.1 Height and Weight

The height and weight of each participant was measured following the standardized STEPS protocol. The body mass index (BMI) of each participant was computed by dividing the weight (kilograms) by the square of the height (metres ${ }^{2}$ ). BMI risk categories are defined as follows:

| Underweight | $\mathrm{BMI}<18.5$ |
| :--- | :--- |
| Normal weight | $18.5 \leq \mathrm{BMI} \leq 24.9$ |
| Overweight | $\mathrm{BMI} \geq 25.0$ |
| Obese | $\mathrm{BMI} \geq 30.0$ |

Tables 35 and 36 show that men were significantly taller ( $169.2 \mathrm{~cm} \pm 0.9$ ) than women ( $158.9 \mathrm{~cm} \pm 0.4$ ) and women were marginally heavier ( $82.8 \mathrm{~kg} \pm 1.6$ ) than men ( 80.9 kg $\pm 2.6$ ) although the difference is not statistically significant.

Table 35 Mean height by gender and age group

| Mean height (cm) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 25-34 | 174 | 169.9 | $\pm 1.2$ | 343 | 158.9 | $\pm 0.5$ |
| 35-44 | 166 | 168.4 | $\pm 1.3$ | 336 | 159.4 | $\pm 0.9$ |
| 45-54 | 166 | 170.1 | $\pm 1.7$ | 356 | 158.8 | $\pm 0.6$ |
| 55-64 | 128 | 167.6 | $\pm 1.2$ | 177 | 157.6 | $\pm 1.0$ |
| 25-64 | 634 | 169.2 | $\pm 0.9$ | 1212 | 158.9 | $\pm 0.4$ |

Among both sexes weight increased after age 35-44 but decreased in the oldest age group. Weight peaked in women in age group 34-44 and in men age group 45-54.

Table 36 Mean weight by gender and age group

| Mean weight (kg) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 25-34 | 172 | 76.6 | $\pm 3.5$ | 312 | 80.3 | $\pm 2.0$ |
| 35-44 | 165 | 81.1 | $\pm 3.9$ | 319 | 85.1 | $\pm 2.4$ |
| 45-54 | 166 | 86.0 | $\pm 3.7$ | 354 | 84.8 | $\pm 2.3$ |
| 55-64 | 126 | 82.7 | $\pm 3.5$ | 176 | 79.9 | $\pm 3.5$ |
| 25-64 | 629 | 80.9 | $\pm 2.6$ | 1161 | 82.8 | $\pm 1.6$ |

Among those aged 15-24 both males and females had achieved the all age group average height, yet both sexes were yet to achieve the all age group average weight.

### 4.7.2 Body Mass Index Categories

Table 37 presents the mean BMI scores for both genders, individually and combined. The overall mean BMI was $30.5 \mathrm{~kg} / \mathrm{m}^{2} \pm 0.7$. Women had a higher mean $\mathrm{BMI}\left(32.7 \mathrm{~kg} / \mathrm{m}^{2}\right.$ $\pm 0.6$ ) than men ( $28.2 \mathrm{~kg} / \mathrm{m}^{2} \pm 0.8$ ) and in all age groups. The mean BMI for both men and women varied little across age groups. Among those aged 15-24 of both genders the BMI was lower than the average BMI in age group 25-34.

Table 37 Mean body mass index ( $\mathrm{kg} / \mathrm{m}^{2}$ ) by gender and age group

| Mean BMI (kg/m ${ }^{2}$ ) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age | Men |  |  | Women |  |  | Both Sexes |  |  |
| Group (years) | n | Mean | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | n | Mean | $\begin{gathered} 95 \% \\ \mathrm{Cl} \\ \hline \end{gathered}$ | n | Mean | $\begin{aligned} & \hline 95 \% \\ & \mathrm{Cl} \\ & \hline \end{aligned}$ |
| 25-34 | 171 | 26.3 | $\pm 1.2$ | 310 | 31.8 | $\pm 0.8$ | 481 | 29.0 | $\pm 0.8$ |
| 35-44 | 162 | 28.8 | $\pm 1.3$ | 316 | 33.4 | $\pm 0.9$ | 478 | 31.2 | $\pm 1.0$ |
| 45-54 | 165 | 29.4 | $\pm 1.1$ | 353 | 33.4 | $\pm 0.9$ | 518 | 31.5 | $\pm 1.0$ |
| 55-64 | 126 | 29.5 | $\pm 1.1$ | 175 | 32.0 | $\pm 1.1$ | 301 | 30.8 | $\pm 0.9$ |
| 25-64 | 624 | 28.2 | $\pm 0.8$ | 1154 | 32.7 | $\pm 0.6$ | 1778 | 30.5 | $\pm 0.7$ |

Tables 38, 39 and 40 present the proportion of the sample population in three BMI classifications - underweight, normal and overweight (includes obese) for men, women and both genders combined. Table 38 shows that $65.2 \% \pm 6.2$ of men are classified as overweight, $34.4 \% \pm 6.2$ as normal and $0.4 \% \pm 0.5$ as underweight.

Table 38 BMI classifications among men by age group

| BMI classifications |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | \% Under- <br> weight <br> $<18.5$ | $95 \% \mathrm{Cl}$ | Men <br> woight <br> $18.5-24.9$ | $95 \% \mathrm{Cl}$ | \% Over- <br> weight <br> $\geq 25.0$ | $95 \% \mathrm{Cl}$ |
| $25-34$ | 171 | --- | $\pm 0.0$ | 50.9 | $\pm 9.2$ | 49.1 | $\pm 9.2$ |
| $35-44$ | 162 | 1.2 | $\pm 1.7$ | 30.2 | $\pm 9.3$ | 68.5 | $\pm 9.2$ |
| $45-54$ | 165 | --- | $\pm 0.0$ | 22.4 | $\pm 9.1$ | 77.6 | $\pm 9.1$ |
| $55-64$ | 126 | 0.8 | $\pm 1.7$ | 21.4 | $\pm 8.9$ | 77.8 | $\pm 9.3$ |
| $25-64$ | 624 | 0.4 | $\pm 0.5$ | 34.4 | $\pm 6.2$ | 65.2 | $\pm 6.2$ |

Table 39 shows that $87.6 \% \pm 2.5$ of women are classified as overweight, $11.8 \% \pm 2.4$ as normal and $0.6 \% \pm 0.5$ as underweight.

Table 39 BMI classifications among women by age group

| BMI classifications |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Women |  |  |  |  |  |  |
|  | n | $\begin{gathered} \text { \% Under- } \\ \text { weight } \\ <18.5 \\ \hline \end{gathered}$ | 95\% CI | $\begin{gathered} \hline \text { \% Normal } \\ \text { weight } \\ 18.5-24.9 \\ \hline \end{gathered}$ | 95\% CI | $\begin{gathered} \text { \% Over- } \\ \text { weight } \\ \geq 25.0 \\ \hline \end{gathered}$ | 95\% CI |
| 25-34 | 310 | 0.6 | $\pm 0.9$ | 17.1 | $\pm 5.6$ | 82.3 | $\pm 5.6$ |
| 35-44 | 316 | 0.9 | $\pm 1.1$ | 9.2 | $\pm 3.5$ | 89.9 | $\pm 3.4$ |
| 45-54 | 353 | ---- | $\pm 0.0$ | 7.6 | $\pm 3.5$ | 92.4 | $\pm 3.5$ |
| 55-64 | 175 | 0.6 | $\pm 1.2$ | 12.6 | $\pm 5.2$ | 86.9 | $\pm 5.4$ |
| 25-64 | 1154 | 0.6 | $\pm 0.5$ | 11.8 | $\pm 2.4$ | 87.6 | $\pm 2.5$ |

Table 40 shows that the proportion of males and females combined classified as being overweight was $76.5 \% \pm 3.6$, as normal $23 \% \pm 3.6$ and $0.5 \% \pm 0.3$ as underweight.

Table 40 BMI classifications among both sexes by age group

| BMI classifications |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group <br> (years) | n | \% Under- <br> weight <br> $<18.5$ | $95 \% \mathrm{Cl}$ | \% Normal <br> weight <br> $18.5-24.9$ | $95 \% \mathrm{Cl}$ | \% Over- <br> weight <br> $\geq 25.0$ | $95 \% \mathrm{Cl}$ |
|  | $25-34$ | 481 | 0.3 | $\pm 0.5$ | 34.4 | $\pm 4.5$ | 65.3 |
| $35-44$ | 478 | 1.1 | $\pm 0.9$ | 19.3 | $\pm 5.2$ | 79.7 | $\pm 4.6$ |
| $45-54$ | 518 | --- | $\pm 0.0$ | 14.8 | $\pm 6.1$ | 85.2 | $\pm 6.4$ |
| $55-64$ | 301 | 0.7 | $\pm 1.0$ | 17.0 | $\pm 5.5$ | 82.3 | $\pm 5.5$ |
| $25-64$ | 1778 | 0.5 | $\pm 0.3$ | 23.0 | $\pm 3.6$ | 76.5 | $\pm 3.6$ |

Table 41 presents rates of obesity ( $\mathrm{BMI} \geq 30 \mathrm{~kg} / \mathrm{m}^{2}$ ) for both genders, individually and combined. The overall prevalence of obesity was $47.3 \% \pm 4.9$. The obesity rate was significantly higher among women ( $63 \% \pm 4.5$ ) than among men ( $31.3 \% \pm 6.3$ ). The
highest prevalence of obesity was in the 45-54 age group (women $68.8 \% \pm 5.1$ and men $40 \% \pm 7.5$ ).

Table 41 Percentage of obesity ( $B M I \geq 30 \mathrm{~kg} / \mathrm{m}^{2}$ ) by gender and age group

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | $\begin{gathered} \% \\ \text { BMI } \geq 30 \end{gathered}$ | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | n | $\begin{gathered} \% \\ \text { BMI } \geq 30 \end{gathered}$ | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | n | $\begin{gathered} \% \\ \text { BMI } \geq 30 \end{gathered}$ | $\begin{aligned} & 95 \% \\ & \mathrm{Cl} \\ & \hline \end{aligned}$ |
| 25-34 | 171 | 21.6 | $\pm 10.5$ | 310 | 57.7 | $\pm 5.3$ | 481 | 39.2 | $\pm 5.8$ |
| 35-44 | 162 | 32.1 | $\pm 8.2$ | 316 | 65.8 | $\pm 7.4$ | 478 | 49.7 | $\pm 7.4$ |
| 45-54 | 165 | 40.0 | $\pm 7.5$ | 353 | 68.8 | $\pm 5.1$ | 518 | 54.8 | $\pm 6.2$ |
| 55-64 | 126 | 38.9 | $\pm 8.5$ | 175 | 58.9 | $\pm 8.5$ | 301 | 48.9 | $\pm 7.6$ |
| 25-64 | 624 | 31.3 | $\pm 6.3$ | 1154 | 63.0 | $\pm 4.5$ | 1778 | 47.3 | $\pm 4.9$ |

### 4.7.3 Waist Circumference

Waist circumference was assessed as a measure of central obesity, a measure of risk of cardiovascular diseases. Table 42 shows the mean waist circumference for both men and women. Women had a significantly higher mean waist circumference ( 101.4 cm $\pm 1.7$ ) than men ( $94.3 \mathrm{~cm} \pm 2.7$ ). The mean waist circumference varied by age to a greater degree among men than women.

Table 42 Mean waist circumference (cm) by gender and age group

| Waist circumference (cm) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 25-34 | 173 | 87.9 | $\pm 3.5$ | 306 | 97.0 | $\pm 2.0$ |
| 35-44 | 165 | 93.9 | $\pm 3.3$ | 314 | 102.5 | $\pm 2.4$ |
| 45-54 | 161 | 100.3 | $\pm 3.0$ | 351 | 104.3 | $\pm 2.3$ |
| 55-64 | 125 | 101.4 | $\pm 4.1$ | 176 | 103.8 | $\pm 2.9$ |
| 25-64 | 624 | 94.3 | $\pm 2.7$ | 1147 | 101.4 | $\pm 1.7$ |

### 4.8 Blood Pressure and Hypertension

As part of the Step 2 protocol, all survey participants aged $25-64$ years had their blood pressure measured and were asked if they had had their blood pressure measured in the last 12 months, within the last 1-5 years or longer, whether they had ever been told in the last 12 months by a health worker that they had high blood pressure, and if they were currently receiving any medical treatment for high blood pressure.

The STEPS protocol reports the presence of hypertension to include people with:

- a mean systolic pressure of $\geq 140 \mathrm{mmHg}$, whether or not they had previously been told by a health worker that they had high blood pressure, OR
- a mean diastolic pressure of $\geq 90 \mathrm{mmHg}$, whether or not they had previously been told by a health worker that they had high blood pressure, OR
- normal mean systolic and diastolic pressures (i.e. normotensive) AND who were currently receiving anti-hypertensive medication, whether or not they had previously been told by a health worker that they had high blood pressure.

Those participants who reported having been previously told by a health worker that they had high blood pressure, but who were normotensive and NOT on anti-hypertensive medication, were NOT included among those considered to have hypertension.

Table 43 presents mean resting systolic blood pressure and Table 44 mean resting diastolic blood pressure for both sexes, and for men and women separately. Table 43 shows a statistically higher mean systolic blood pressure in males than in females (121.5 $\pm 2.0$ and $115.2 \pm 1.4$ respectively). Systolic blood pressure increases with age in both sexes, particularly in the age group 55-64.

Table 43 Mean resting systolic blood pressure ( mmHg ) by gender and age group

| Mean systolic blood pressure ( mmHg ) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | $\begin{gathered} 95 \% \\ \mathrm{Cl} \\ \hline \end{gathered}$ |
| 25-34 | 174 | 117.9 | $\pm 2.2$ | 343 | 107.7 | $\pm 1.7$ | 517 | 112.7 | $\pm 1.4$ |
| 35-44 | 167 | 118.8 | $\pm 2.9$ | 337 | 113.4 | $\pm 1.8$ | 504 | 115.9 | $\pm 1.8$ |
| 45-54 | 166 | 124.4 | $\pm 4.2$ | 356 | 121.5 | $\pm 2.9$ | 522 | 122.9 | $\pm 2.7$ |
| 55-64 | 128 | 131.5 | $\pm 4.3$ | 177 | 127.4 | $\pm 3.3$ | 305 | 129.4 | $\pm 3.0$ |
| 25-64 | 635 | 121.5 | $\pm 2.0$ | 1213 | 115.2 | $\pm 1.4$ | 1848 | 118.3 | $\pm 1.3$ |

Table 44 shows a similar mean diastolic blood pressure in males and females ( $73.6 \pm 1.8$ and $73.3 \pm 1.1$ respectively), increasing with age in both genders from age group 45-54.

Table 44 Mean resting diastolic blood pressure $(\mathbf{m m H g})$ by gender and age group

| Mean diastolic blood pressure (mmHg) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | $\begin{aligned} & 95 \% \\ & \text { CI } \end{aligned}$ |
| 25-34 | 174 | 68.2 | $\pm 2.4$ | 343 | 70.0 | $\pm 1.1$ | 517 | 69.1 | $\pm 1.5$ |
| 35-44 | 167 | 74.0 | $\pm 2.3$ | 337 | 73.1 | $\pm 1.5$ | 504 | 73.5 | $\pm 1.4$ |
| 45-54 | 166 | 77.9 | $\pm 2.7$ | 356 | 76.2 | $\pm 1.9$ | 522 | 77.0 | $\pm 2.0$ |
| 55-64 | 128 | 78.9 | $\pm 2.5$ | 177 | 76.8 | $\pm 1.6$ | 305 | 77.8 | $\pm 1.5$ |
| 25-64 | 635 | 73.6 | $\pm 1.8$ | 1213 | 73.3 | $\pm 1.1$ | 1848 | 73.4 | $\pm 1.2$ |

Table 45 presents the prevalence of hypertension in the population, consistent with the above definition. Hypertension was found in $15.8 \% \pm 3.6$ of men and $14.6 \% \pm 1.8$ of women and $15.2 \% \pm 2$ overall. The prevalence of hypertension increased with increasing age in both men and women. From the base of age group of 35-44, the male and female rates more than double in age group 45-54 (9.6\% to 22.3\% for males and 11\% to 23.6\% for females). In age group 55-64 the male rate doubles again and the female rate increases by half.

Table 45 Percentage with hypertension (SBP $\geq \mathbf{1 4 0}$ and/or DBP $\geq \mathbf{9 0}$ or currently on medication for raised blood pressure)

| SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication for raised blood pressure |  |  |  |  |  |  |  |  |  |

| 25-34 | 174 | 5.7 | $\pm 4.3$ | 343 | 4.1 | $\pm 2.3$ | 517 | 4.9 | $\pm 2.3$ |
| 35-44 | 167 | 9.6 | $\pm 4.0$ | 337 | 11.0 | $\pm 3.5$ | 504 | 10.3 | $\pm 2.5$ |
| 45-54 | 166 | 22.3 | $\pm 5.7$ | 356 | 23.6 | $\pm 4.0$ | 522 | 23.0 | $\pm 4.0$ |
| 55-64 | 128 | 43.0 | $\pm 10.8$ | 177 | 33.9 | $\pm 6.9$ | 305 | 38.4 | $\pm 7.8$ |
| 25-64 | 635 | 15.8 | $\pm 3.6$ | 1213 | 14.6 | $\pm 1.8$ | 1848 | 15.2 | $\pm 2.0$ |

### 4.9 Fasting Blood Glucose and Diabetes

Survey participants were asked if they had been told by a health worker in the previous 12 months that they had diabetes, within 1-5 years or longer, and whether they were currently receiving medical treatment for diabetes. To measure fasting blood sugar levels, capillary whole blood was drawn using the finger prick method.

Estimates of diabetes prevalence were computed based on the capillary whole blood glucose test results and by following the WHO guidelines for defining and classifying diabetes mellitus

- fasting capillary whole blood value of glucose greater than or equal to $6.1 \mathrm{mmol} / \mathrm{L}$ ( $\geq 110 \mathrm{mg} / \mathrm{dl}$ ) whether or not they had previously been told by a health worker that they had diabetes, OR
- normal capillary whole blood value of glucose less than $6.1 \mathrm{mmol} / \mathrm{L}$ ( $<110 \mathrm{mg} / \mathrm{dl}$ ) AND who were currently receiving anti-diabetes medication prescribed by a health worker.

Those participants who had been advised by a health worker that they had diabetes but who had normal fasting blood glucose, and who were NOT on anti-diabetes medication or on a special diet prescribed by a health worker, were NOT included among those considered as having diabetes.

Table 46 summarizes results on mean fasting blood glucose for both genders individually and combined. The overall mean fasting blood glucose was $6 \mathrm{mmol} / \mathrm{L} \pm 0.2$. Men reported a marginally lower mean fasting glucose level ( $5.9 \mathrm{mmol} / \mathrm{L} \pm 0.2$ ) than
women ( $6.2 \mathrm{mmo} / \mathrm{L} \pm 0.3$ ). For both men and women, mean fasting blood glucose levels increased with increasing age, peaked in males in the oldest age group and in females aged 45-54.

Table 48 shows the prevalence of diabetes for both genders individually and combined. The overall prevalence diabetes was $35.4 \% \pm 5.6$. Diabetes prevalence was only marginally greater in women than in men ( $36.4 \% \pm 5.7$ and $34.4 \% \pm 7$ respectively). More than half of the sample in the age group $45-54$ was diabetic ( $53.4 \% \pm 7.5$ ). The onset of adult diabetes is evident in the increase in age group 35-44 thereafter both gender rates increase with increasing age.

** capillary whole blood value: $\geq 6.1 \mathrm{mmol} / \mathrm{L}$

### 4.10 Total Cholesterol

For elevated total blood cholesterol, a cut-off point $\geq 5.0 \mathrm{mmol} / \mathrm{L}$ (or $\geq 190 \mathrm{mg} / \mathrm{dl}$ ) was used to classify participants as being in a high-risk group for coronary artery disease.

Table 49 shows the overall mean cholesterol level for both genders individually and combined. The overall mean was $4.6 \mathrm{mmol} / \mathrm{L} \pm 0.1$ and similar mean levels for men ( 4.5 $\mathrm{mmol} / \mathrm{L} \pm 0.1$ ) and women ( $4.7 \mathrm{mmol} / \mathrm{L} \pm 0.1$ ) showed little variance across age groups.

Table 49 Mean levels of total blood cholesterol (mmol/L) by gender and age group

| Mean total cholesterol (mmol/L) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age | Men |  |  | Women |  |  | Both Sexes |  |  |
| Group (years) | n | Mean | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | n | Mean | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | n | Mean | 95\% CI |

| 25-64 | 147 | 4.5 | $\pm 0.1$ | 410 | 4.7 | $\pm 0.1$ | 557 | 4.6 | $\pm 0.1$ |

Table 50 shows the mean levels of blood cholesterol by age for both genders individually and combined. Mean total blood cholesterol in women was greater than in men ( $182.8 \mathrm{mg} / \mathrm{dl} \pm 3.4$ and $174.7 \mathrm{mg} / \mathrm{dl} \pm 4.3$ respectively) and in all age groups, although the differences were not statistically significant.

### 4.11 Combined Risk Factors

To summarize the findings for the five important risk factors for NCDs, the following factors were combined and are presented in Tables 52, 53, and 54 in two age groups, 25-44 and 45-64.

- current daily smokers,
- overweight ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ),
- raised blood pressure (SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication),
- consumed less than five combined servings of fruit and vegetables per day, and
- low level of activity (<600 METminutes per week).

These five risk factors were summed to indicate the overall risk for NCDs as follows:

- Low Risk: 0 of 5 risk factors
- Moderate Risk: 1 or 2 of 5 risk factors
- High Risk: 3 or more of 5 risk factors

Table 52 shows that almost two thirds of male respondents $(62.4 \% \pm 6)$ were classified as at High Risk and more than a third $(36.3 \% \pm 5.7)$ as at Moderate Risk.

Table 52 Percentage of NCD risk categories among men by age group

| Raised Risk |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age | Men <br> (yours) |  |  |  |  |  |  |
|  | n | \% with 0 <br> risk <br> factors | $95 \% \mathrm{Cl}$ | \% with 1-2 <br> risk <br> factors | $95 \% \mathrm{Cl}$ | \% with 3-5 <br> risk <br> factors | $95 \% \mathrm{Cl}$ |
| $25-44$ | 293 | 1.4 | $\pm 1.2$ | 44.4 | $\pm 6.2$ | 54.2 | $\pm 6.6$ |
| $45-64$ | 260 | 1.3 | $\pm 1.5$ | 23.2 | $\pm 7.4$ | 75.5 | $\pm 8.2$ |
| $25-64$ | 553 | 1.3 | $\pm 0.9$ | 36.3 | $\pm 5.7$ | 62.4 | $\pm 6.0$ |

Table 53 shows women at the same level of risk as men with $62.4 \% \pm 5.3$ at High Risk and $36.9 \% \pm 5.1$ at Moderate Risk.

Table 53 Percentage of NCD risk categories among women by age group

| Raised Risk |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age <br> Group (years) | Women |  |  |  |  |  |  |
|  | n | \% with 0 <br> risk <br> factors | 95\% CI | $\begin{gathered} \hline \% \text { with 1-2 } \\ \text { risk } \\ \text { factors } \\ \hline \end{gathered}$ | 95\% CI | \% with 3-5 risk factors | 95\% CI |
| 25-44 | 561 | 0.7 | $\pm 0.7$ | 40.3 | $\pm 6.1$ | 59.0 | $\pm 6.3$ |
| 45-64 | 475 | 0.4 | $\pm 0.6$ | 31.7 | $\pm 5.8$ | 67.8 | $\pm 6.0$ |
| 25-64 | 1036 | 0.6 | $\pm 0.5$ | 36.9 | $\pm 5.1$ | 62.4 | $\pm 5.3$ |

Table 54 shows that the highest level of risk $(71.5 \% \pm 5.6)$ was in the older age group, although $56.6 \% \pm 5$ in the younger group were also at high risk. Overall, $62.4 \% \pm 4.7$ of the Chuuk population was at High Risk of NCDs.

Table 54 Percentage of NCD risk categories among both sexes by age group

| $25-64$ | 1589 | 1.0 | $\pm 0.5$ | 36.6 | $\pm 4.5$ | 62.4 | $\pm 4.7$ |  |  |  |  |  |  |  |  |

## 5. DISCUSSION AND CONCLUSIONS

This section summarizes key findings from the STEPS survey and presents a range of recommendations to control and prevent NCDs in the State of Chuuk.

Behavioural risk factors for NCDs are common in the State of Chuuk and present a public health problem for both sexes at all ages of adulthood, with almost two thirds (62.4\%) of the population aged $25-64$ classified as being at High Risk of developing an NCD (with 3-5 concurrent risk factors). The highest level of combined risk factors is in the 45-64 age groups in both sexes. An additional third (36.6\%) of the population was at Moderate Risk with 1-2 concurrent risk factors. As the combination of risk factors increase the risk of developing and dying from a NCD also increases. The prevalence of combined risk factors in Chuuk was marginally higher than in Pohnpei, significantly higher than in the Solomon Islands but lower than in the Cook Islands and in Kiribati ${ }^{811}$.

Significantly more females abstain from smoking than males (86\% and 49\% respectively). This gender difference appears to have a socio-cultural significance which is worth investigating for its potential wider application. Those females that do smoke have similar duration of usage to men. For current smokers, smoking uptake occurred in the late teens for males and early 20s for females. Betel nut appears to be used only by younger people as the usage drops off to negligible levels in the older age groups reducing the risk of oral cancers.

Just over one third of males were classified as current drinkers and a negligible proportion of females. This gender difference has socio-cultural significance as most women declared themselves 'lifetime abstainers'. Interestingly, 41\% of men also declared themselves 'lifetime abstainers'. The highest proportion of current drinkers and the highest frequency of drinking among men occur in the youngest age group, although men in the oldest age groups drank the highest number of standard drinks on any drinking day.

The majority (90.4\%) of the population did not consume the recommended five combined servings of fruit and vegetables per day. The consumption of fruit and vegetables did not differ much across gender and age groups but suggest that males of the age group 55-64 were less well fed than the rest of the population. The low level of fruit and vegetable consumption is consistent with the low level of agriculture, which in turn suggests high levels of food importation.

That more than a half of males and over two thirds of females reported low levels of physical activity may also be consequent to the low level of agricultural productivity. As measured by METminutes, males engaged in more physical activity than females across all age groups and activity related groups (work, transport and recreation), but both genders scored low levels of physical activity per week.

Although low physical activity, in comparison with others, METminutes in Chuuk overall (428) were marginally higher than in Pohnpei (387) and in Kiribati (344.5) and significantly higher than Cook Islands (238.5), but less than in the Solomons (505). Young people in the age group 15-24 engaged in less METminutes per week than the $25-64$ years age groups (351.5 METminutes for males and 263 for females). Work related physical activity accounted for significantly more physical activity among men.

BMI for females was significantly higher than for males in all age groups. Almost two thirds of women (63\%) and one third of men (31.3\%) were classified as obese. Obesity in males is significantly less prevalent than in Pohnpei, Kiribati and Cook Islands but more so than in the Solomon Islands ${ }^{8-11}$. The highest proportions of overweight and obese females were in the 35-44 and 45-54 year age groups, while the highest proportion of overweight and obese males were in the 45-54 age group. This decade difference may be explained by a combination of biological and social roles, where females are still in the reproductive years and males have decreased their level of physical activity and increased their waist circumference.

The mean waist circumference in women increased in the $35-44$ age group to 102.5 cm , exceeding 88 cm , a cut-off value for women considered to increase cardiovascular disease risk. Mean waist circumference in men increased a decade later in the 45-54 age group to 100.3 cm but remained below 102 cm where the risk of cardiovascular disease increases.

Hypertension was estimated to be $15.2 \%$ of the population. Males in the 55-64 year group appear to have the highest rate. A substantial proportion (38\%) of the older population either has hypertension and an elevated risk of developing cardiovascular disease or stroke, raising a significant risk of premature adult mortality.

Concurrently, over one third of the population (35.4\%) and two thirds (66.3\%) of those aged $55-64$ has diabetes. Both sexes show the marked increase associated with adult onset in the 45-54 age group. In comparison to Pohnpei and other Kiribati, Cook Islands, and in particular the Solomon Islands ${ }^{8-11}$, Chuuk shows the highest rate of diabetes, and, although it is not statistically different to Pohnpei, it is identified as a major threat to population health.

Almost one fifth (19.2\%) of the population was found to have elevated fasting blood cholesterol, increasing in women in the 35-44 age group and in men a decade later in the $45-54$ group. Rates in females continue to rise to a significantly degree to $47 \%$ in the 55-64 age group.

These behavioural, physiological and biochemical measures indicate the significant presence of NCDs and NCD risk factors in the Chuuk State, all of which increased markedly in the older age groups. While the behavioural risk factor data were collected from self-reports and, as such, the prevalence of some risk factors may be overestimated or under-estimated, the key strength of the survey is its size and its population-wide characteristics. Most importantly, after weighting of the data, this STEPS survey can represent the whole population aged $25-64$ years of the State of Chuuk.

The Chuuk STEPS survey has confirmed that NCDs pose a significant threat to public health and longevity, and a challenge to national productivity. A national strategy is required to address cross-sector contributing factors, such as the availability of fruit and vegetables for daily consumption, the licensing and regulation of products that impact adversely on health status, health education campaigns on the outcomes of risk laden behaviors, particularly among young people who may yet have the potential to avoid NCDs.

Importantly, all of the risk factors mentioned herein are modifiable. However, for such a strategy to be effective, the population has to recognize the risks and value the outcome of improved health. This change will need to be driven by information, such as that provided in this STEPS report and provided in a manner that is sensitive to the prevailing social, economic and cultural environments of Chuuk State and its people.

## 6. RECOMMENDATIONS

## Addressing Information needs

That the Department of Health

- Use the opportunity of the publication of this FSM (Chuuk) NCD Risk Factors STEPS Report to initiate a new NCD risk factor prevention and reduction campaign in the State of Chuuk
- Establish strong leadership and secure political and financial commitment to maintain a systematic and rigorous approach to STEPS data collection supported by a workforce trained in implementing the survey, in order to create an ongoing and robust STEPS surveillance system in Chuuk
- Coordinate and conduct the $2^{\text {nd }}$-round NCD STEPS survey as a whole country (rather than individual state) to determine the effectiveness
- Participate in the comparison of NCD STEPS data across other Pacific Island countries that have completed the NCD STEPS surveys and published STEPS reports ${ }^{8-11}$, in order to identify the risk factors that are particular to and most amenable to modification, as well as to identify the evidence-based prioritized intervention in Chuuk, FSM

## Addressing policy, organizational and environmental factors

That government of FSM:

- Earmark funds for ongoing NCD strategy implementation and monitoring in Chuuk
- Implement the WHO Framework Convention on Tobacco Control
- Consider the potential for manufacturers and importers of cigarettes and alcohol to be taxed to the degree that they subsidize health promotion initiatives
- Generate resources for ongoing national health education programs aimed at national and personal productivity
- Develop policies supporting the growth and importation of healthy foods
- Improve the availability of fruit and vegetables
- Develop policies to establish physical activity-friendly environments, such as walking tracks, sports facilities and workplace fitness programs

## Addressing NCD behavioural risk factors

That government, Department of Health and NGOs create and provide:

- Comprehensive no-smoking and no-betel nut use campaigns to reduce tobacco use rates, particularly targeting teenagers and the younger adult age groups to prevent
smoking uptake, and smoking cessation programs to reduce smoking rates across all age groups
- Integrated health promotion campaigns to reduce alcohol consumption, particularly targeted at young people and binge drinking
- Comprehensive health promotion campaigns promoting the consumption of the recommended levels of fruit and vegetables, inclusive of an expressed strategy to ensure proper nutrition in older age
- Public awareness of the adverse effects of excessive consumption of high-fat, highsalt, and high-sugar foods
- Culturally-appropriate and diverse programs to promote daily physical activity
- Public awareness campaigns on the importance of regular monitoring and screening of blood pressure, blood cholesterol and blood sugar levels
- Public awareness programs targeted to increase awareness of the multipliers of NCD risk associated with combining the 5 major NCD risk factors (current daily smoking, being overweight, having raised blood pressure, eating less than five combined servings of fruit and vegetables per day, and having a low level of physical activity)
- A system of community-based care for the management of individuals with diagnosed NCDs

## APPENDICES

## Step 1 Behavioural Measures

## Tobacco Use (Section S)

Now I am going to ask you some questions about various health behaviours. This includes things like smoking, drinking alcohol, eating fruits and vegetables and physical activity. Let's start with smoking.

| S 1a | Do you currently smoke any tobacco products, such as cigarettes, cigars or pipes? | Yes 1 <br> No 2 |  | If No , go to S5 |
| :---: | :---: | :---: | :---: | :---: |
| S 1b | If Yes, <br> Do you currently smoke tobacco products daily? | Yes 1 <br> No 2 | $\square$ | If No , go to S5 |
| S 2a | How old were you when you first started smoking daily? | Age (years) <br> Don't remember D K |  | If Known, go to S 3 |
| S 2b | Do you remember how long ago it was? | In Years <br> OR in Months <br> OR in Weeks |  |  |
| S 3 | On average, how many of the following do you smoke each day? <br> (RECORD FOR EACH TYPE) | Manufactured cigarettes <br> Hand-rolled cigarettes <br> Pipes full of tobacco <br> Cigars, cheroots, cigarillos <br> Other (please specify): |  |  |
| S 4 | If you smoke, how useful would each of the following be in helping you to quit? <br> (code for each group as below) | Friends Substance abuse \& mental health program staff Medical Doctor Hang out with friends who don't smoke Pastor/Minister/Priest Youth groups Teacher/Professor Uncles, spouse or other relatives Parents Exercise/Increase participation in sports Stay away from bars/night clubs | $\square$ |  |
| S 5 | In the past did you ever smoke daily? | $\begin{array}{ll}\text { Yes } & 1 \\ \text { No } & 2\end{array}$ |  | If No , go to S7a |
| S 6a | How old were you when you stopped smoking daily? |  |  |  |
| S 6b | If you don't remember how old you were, how long ago? |  In Years <br> OR in Months <br> OR in Weeks |  |  |
| S 7a | Do you currently use smokeless tobacco such as chewing tobacco or snuff? | $\begin{array}{ll} \text { Yes } & 1 \\ \text { No } & 2 \end{array}$ |  | If No, go to S9 |
| S 7b | if Yes, do you currently use smokeless tobacco products daily? | $\begin{array}{ll} \text { Yes } & 1 \\ \text { No } & 2 \end{array}$ |  |  |
| S 8 | On average, how many times do you use smokeless tobacco on the days that you use it? | Number of times per day |  |  |

| Alcohol Consumption (Section A) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| The next questions ask about the consumption of alcohol. |  |  |  |  |
|  |  | Response |  | Coding Column |
| A 1a | Have you ever consumed a drink that contains alcohol such as beer, wine, spirit or fermented cider? <br> USE SHOWCARD or SHOW EXAMPLES | Yes No | 1 2 |  |
| A 1b | Have you consumed alcohol within the past 12 months? | $\begin{aligned} & \text { Yes } \\ & \text { No } \end{aligned}$ | 1 2 |  |
| A 2 | In the past 12 months, how frequently have you had at least one drink? <br> (READ RESPONSES) <br> USE SHOWCARD | 5 or more days a week <br> 1-4 days per week <br> 1-3 days a month <br> Less than once a month | $\begin{aligned} & 1 \\ & 2 \\ & 3 \\ & 4 \end{aligned}$ |  |
| A 3 | When you drink alcohol, on average, how many drinks do you have during one day? | Number Don't know |  |  |

Note: Code DK for "Don't know" or "Don't remember

| D 3 | On how many days do you eat the following in a typical week? |  | Meat <br> Chicken <br> Eggs <br> Milk Products <br> Fish |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Do you usually prepare meals? | Yes No | 1 2 | $\square$ |
| D 4b | What type of oil or fat is most often used for meal preparation in your household? <br> SELECT ONLY ONE | Vegetable oil Lard or suet Butter Margarine Coconut oil Other None in particular None used Don't know | $\begin{aligned} & 1 \\ & 2 \\ & 3 \\ & 4 \\ & 5 \\ & 6 \\ & 7 \\ & 8 \end{aligned}$ |  |
| D 5 | In a typical week, on how many days do you eat fresh fish? | Number of days |  |  |
| D 6 | In a typical week, on how many days do you eat canned fish? | Number of days |  | $\square$ |

Note: Code DK for "Don't know" or "Don't remember".

## Physical Activity (Section P)

Next I am going to ask you about the time you spend doing different types of physical activity. Please answer these questions even if you do not consider yourself to be an active person.
Think first about the time you spend doing work. Think of work as the things that you have to do such as paid or unpaid work, household chores, harvesting food, fishing or hunting for food, seeking employment. [Insert other examples if needed]

Other than activities that you've already mentioned, I would like to ask you about the way you travel to and from places. For example to work, for shopping, to market, to church. [insert other examples if needed]

The next questions ask about activities you do in your leisure time. Think about activities you do for recreation, fitness or sports [insert relevant terms]. Do not include the physical activities you do at work or for travel mentioned already.

| P 9 | Does your [recreation, sport or leisure time] involve mostly sitting, reclining, or standing, with no physical activity lasting more than 10 minutes at a time? | Yes No |  | $\square$ |
| :---: | :---: | :---: | :---: | :---: |
| P 10 | In your [leisure time], do you do any vigorous activities like [running or strenuous sports, weight lifting] for at least 10 minutes at a time? <br> INSERT EXAMPLES \& USE SHOWCARD | Yes No |  | ] |
| P 11a | If Yes, <br> In a typical week, on how many days do you do vigorous activities as part of your [leisure time]? | Days a week |  |  |
| P 11b | On a typical day on which you do vigorous activity as part of your [leisure time], how much time do you spend doing this? | In hours and minutes OR in Minutes only |  | $\square$ $\square$ <br> or minutes $\square$ $\square$ $\square$ |

If Yes, go to $P$
14

If No, go to $P$
12

| P 12 | In your [leisure time], do you do any moderate-intensity activities like brisk walking,[cycling or swimming] for at least 10 minutes at a time? <br> INSERT EXAMPLES \& USE SHOWCARD | Yes No |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| P 13a | If Yes <br> In a typical week, on how many days do you do moderate-intensity activities as part of [leisure time]? | Days a week |  |  |  |
| P 13b | On a typical day on which you do moderate-intensity activity as part of your [leisure time], how much time do you spend doing this? | In hours and minutes OR in Minutes only |  |  |  |

The following question is about sitting or reclining. Think back over the past 7 days, to time spent at work, at home, in [leisure], including time spent sitting at a desk, visiting friends, reading, or watching television, but do not include time spent sleeping.

| H 14 | In the last 12 months, have you had a pneumonia shot? This shot is usually given only once or twice in a person's lifetime and is different from the flu shot. It is also called pneumococcal vaccine. |  | Don't |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Comments: Step 1 |  |  | (to be answered by the Interviewer) |  |  |  |
| V 2 |  | Are there any irregularities or problems with the questions? |  | Yes No | 2 |  |

If yes, please describe. $\qquad$

If yes, please describe. $\qquad$

Hazardous Description: Percentage of current (last 30 days) drinker engaging in hazardous and and harmful drinking in the last 7 days.
harmful Harmful drinking is defined as $\geq 60 \mathrm{~g}$ of pure alcohol on average per day for men and drinking $\quad \geq 40 \mathrm{~g}$ for women.

Hazardous drinking is defined as 40-59.9g of pure alcohol on average per day for men and 20-39.9g for women.
A standard drink contains approximately 10 g of pure alcohol.
Instrument question:

- During each of the past 7 days, how many standard drinks of any alcoholic drink did you have each day?

## Physical Activity

Introduction Analysis physical activity data can be very complicated and the result confusing. The following guidelines will help clarify the results of the physical activity data and will also provide valuable information on the classifications. Make sure you use some of these guidelines when you report physical activity data.

- MET values are applied to vigorous and moderate intensity variables in the work, transport and recreation domains. These have been calculated using an average of the typical types of activity undertaken. Different types of activities have been grouped together and given a MET value based on the intensity of the activity. Applying MET values to types of activities allows us to calculate total physical activity. For more information regarding MET values go the STEPS website at www.who.int/chp/steps .
- The calculations below use multiple questions in the physical activity section. To simplify this a bit the questions have been clustered into four groups (as they appear in the Instrument). In the Instrument questions section of the table, only the group label appears. The specific questions for each group are presented below.
- Activity at work:
- Does your work involve vigorous-intensity activity that causes large increases in breathing or heart rate like [examples] for at least 10 minutes continuously?
- In a typical week, on how many days do you do vigorous-intensity activities as part of your work?
- How much time do you spend doing vigorous-intensity activities at work on a typical day?
- Does your work involve moderate-intensity activity, that causes small increases in breathing or heart rate such as brisk walking for at least 10 minutes continuously?
- In a typical week, on how many days do you do moderate-intensity activities as part of your work?
- How much time do you spend doing moderate-intensity activities at work on a typical day?
$-$
- Travel to and from places:
- Do you walk or use a bicycle for at least 10 minutes continuously to get to and from places?
- In a typical week, on how many days do you walk or bicycle for at least 10 minutes continuously to get to and from places?

## Physical Activity, Continued

Introduction
(cont.)

- How much time do you spend walking or bicycling for travel on a typical day?
- 
- Recreational activities:
- Do you do any involve vigorous-intensity sports, fitness or recreational activities that cause large increases in breathing or heart rate like [examples] for at least 10 minutes continuously?
- In a typical week, on how many days do you do vigorous-intensity sports, fitness or recreational activities?
- How much time do you spend doing vigorous-intensity sports, fitness or recreational activities on a typical day?
- Do you do any involve moderate-intensity sports, fitness or recreational activities that cause large increases in breathing or heart rate like [examples] for at least 10 minutes continuously?
- In a typical week, on how many days do you do moderate--intensity sports, fitness or recreational activities?
- How much time do you spend doing moderate--intensity sports, fitness or recreational activities on a typical day?
- Sedentary behaviour :
- How much time do you usually spend sitting or reclining on a typical day?

## Biochemical Measurements

Mean Description: mean fasting blood glucose results excluding those currently on fasting blood glucose medication for diabetes (Non-fasting recipients excluded).
Instrument questions:

- Are you currently receiving any of the following treatments for diabetes prescribed by a doctor or other health worker?
- Insulin?
- Oral drugs (medication) that you have taken in the last 2 weeks?
- During the last 12 hours have you had anything to eat or drink, other than water?
- Blood glucose measurement

| Mean fasting blood glucose (mmol/L) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 25-34 | 50 | 5.4 | 5.1-5.6 | 109 | 5.2 | 5.0-5.4 | 159 | 5.3 | 5.1-5.4 |

| 45-54 | 58 | 113.9 | 105.0-122.8 | 148 | 132.1 | 117.9-146.3 | 206 | 123.4 | 115.1-131.8 |
| 55-64 | 39 | 134.5 | 116.3-152.7 | 76 | 122.5 | 110.9-134.1 | 115 | 128.1 | 117.0-139.2 |
| 25-64 | 209 | 106.1 | 102.6-109.7 | 461 | 111.2 | 105.5-116.9 | 670 | 108.8 | 104.9-112.6 |

Raised blood Description: Categorization of respondents into blood glucose level categories glucose and percentage currently on medication for raised blood glucose (non-fasting recipients excluded).

Instrument questions:

- Are you currently receiving any of the following treatments for diabetes prescribed by a doctor or other health worker?
$\bullet$ Insulin?
- Oral drugs (medication) that you have taken in the last 2 weeks?
- During the last 12 hours have you had anything to eat or drink, other than water?
- Blood glucose measurement

* Impaired fasting glycaemia is defined as either
- plasma venous value: $\geq 6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$ and $<7.0 \mathrm{mmol} / \mathrm{L}(126 \mathrm{mg} / \mathrm{dl})$
- capillary whole blood value: $\geq 5.6 \mathrm{mmol} / \mathrm{L}(100 \mathrm{mg} / \mathrm{dl})$ and $<6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$
** Raised blood glucose is defined as either
- plasma venous value: $\geq 7.0 \mathrm{mmol} / \mathrm{L}(126 \mathrm{mg} / \mathrm{dl})$
- capillary whole blood value: $\geq 6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$

Total cholesterol

Description: Mean total cholesterol among all respondents and percentage of respondents with raised total cholesterol.

Instrument question:

- Total cholesterol measurement

| Mean total cholesterol (mmol/L) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 25-34 | 22 | 4.3 | 4.2-4.4 | 65 | 4.5 | 4.3-4.7 | 87 | 4.4 | 4.3-4.5 |
| 35-44 | 34 | 4.5 | 4.3-4.7 | 108 | 4.7 | 4.5-4.8 | 142 | 4.6 | 4.5-4.7 |
| 45-54 | 55 | 4.7 | 4.5-5.0 | 152 | 4.8 | $4.7-4.9$ | 207 | 4.8 | 4.6-4.9 |
| 55-64 | 36 | 4.6 | 4.3-4.8 | 85 | 5.1 | 4.9-5.2 | 121 | 4.9 | 4.7-5.1 |
| 25-64 | 147 | 4.5 | 4.4-4.6 | 410 | 4.7 | 4.6-4.8 | 557 | 4.6 | 4.6-4.7 |

| Mean total cholesterol (mg/dl) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 25-34 | 22 | 164.6 | 160.6-168.7 | 65 | 174.0 | 167.3-180.6 | 87 | 170.1 | 166.0-174.1 |

## Raised Risk

Raised risk Description: Percentage of respondents with 0, 1-2, or 3-5 of the following risk factors:

- current daily smoker
- less than 5 servings of fruits \& vegetables per day
- low level of activity (<600 MET -minutes)
- overweight or obese ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ )
- raised BP (SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication for raised BP).

Instrument questions: combined from Step 1 and Step 2

| Raised Risk |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
